from	Kimberly Comacho, Senior Managing Associate Jacqueline De La Rocha, Managing Associate
subject	21611 Perry Street Project – Revised Project

The 21611 Perry Street Project (proposed project) was analyzed in an Initial Study/Mitigated Negative Declaration (IS/MND). The Draft IS/MND was circulated for public review on May 26, 2022. A Final IS/MND was included as part of a staff report released on August 31, 2022. The proposed project analyzed in the IS/MND included the development of a self-storage facility with three buildings totaling approximately 113,714 square feet. The self-storage facility would consist of a mix of one- and two-story buildings with a maximum height of 31 feet. The self-storage facility would include 109,039 square feet of self-storage uses, a 2,425-square-foot lobby/self-storage office area, a 1,550-square-foot retail use for a cafe, and a 700-square-foot retail use (likely a mail service store such as United Postal Service [UPS] or Federal Express [FedEx]) comprising a total of 4,675 square feet for these uses. The proposed project would provide 41 parking spaces that would be accessed from one driveway providing ingress/egress off South Perry Street. The proposed project would provide approximately 12,134 square feet of landscaping around the perimeter of the project site.

Subsequent to the release of the Final IS/MND on August 31, 2022, the development plan for the proposed self-storage development was updated and resulted in an increase of 8,061 square feet of self-storage uses spread across the three proposed buildings, for a revised total building square footage of 121,775 square feet (revised project). The floor area ratio (FAR) would increase from 0.932 FAR to 0.998 FAR, an increase of 0.066 FAR. The square footages for the lobby/self-storage office area, cafe, and retail use would remain unchanged. The revised project would also include a minor increase in height of 5 feet (from 31 feet to 36 feet) to Building A, which is located along Carson Street. No changes to the number of parking spaces or landscaping area, are proposed. Access to and from the project site would also not change.

Given that the assumptions for building layout, footprint, massing, building materials, grading and excavation, and number of employees would not change, the impacts determined for aesthetics, agricultural and forestry resources, biological resources, cultural resources, geology and soils, hazards and hazardous materials, hydrology and water quality, land use and planning, mineral resources, population and housing, public services, recreation, tribal cultural resources, and wildfire would remain less than significant or less than significant with mitigation as analyzed in the IS/MND. As the additional 8,061 square feet proposed for the revised project has the potential to affect analysis

related to construction of the proposed building and operation of the uses onsite, analysis related to air quality, energy, greenhouse gas (GHG) emissions, noise, transportation, and utilities and service systems are discussed in further detail, below.

Air Quality

As it relates to air quality during construction of the revised project, the development of an additional 8,061 square feet would equate to an increase in approximately 7 percent of building construction. The construction schedule is assumed to be extended to accommodate the construction of the additional building square footage. However, conservatively, if construction of the 8,061 square feet would occur within the construction schedule assumed in the IS/MND, air quality emissions for the phases associated with the building construction (i.e., foundations, building construction, architectural coating, and painting) would increase by approximately 7 percent. When applied to the construction emissions shown on **Table 2**, *Maximum Regional Construction Emissions – Without Mitigation*, on page 26 of the IS/MND, while the air quality emissions would marginally increase, air quality emissions would not exceed the South Coast Air Quality Management District (SCAQMD) threshold. A similar conclusion can be made as it relates to localized construction emission and toxic air contaminants during construction of the revised project.

Operation of the revised project would also similarly increase area emissions and energy usage by 7 percent. In the 21611 South Perry Street Self-Storage/Mixed-Use Project Revised Project Description Traffic and Parking Study (Traffic and Parking Study) prepared by Fehr & Peers, see Attachment A, daily trips would increase by 50 trips, which would also marginally increase mobile emissions. Overall, the operational emissions of the proposed project shown in **Table 3**, *Maximum Unmitigated Regional Operational Emissions*, on page 28 of the IS/MND, are well below the SCAQMD threshold under the proposed project and would continue to be even with the addition of 8,061 square feet of self-storage uses under the revised project. A similar conclusion can be made as it relates to localized operational emission and toxic air contaminants during operation of the revised project.

Therefore, construction and operational impacts related to air quality would remain the same as those in the IS/MND.

Energy

Similar to the air quality discussion above, electricity, natural gas, and transportation fuel usage would increase during construction of the revised project (assuming a longer construction schedule) and during operation (assuming an increase in building square footage and number of trips to the project site). However, given that the project characteristics of the revised project (e.g., location, proposed uses) would remain the same as those of the proposed project, the revised project would not result in wasteful, inefficient, and unnecessary consumption of transportation fuel, nor would the revised project conflict with or obstruct a State or local plan for renewable energy or energy efficiency.

Therefore, construction and operational energy impacts would remain the same as those in the IS/MND.

GHG

GHG emissions would increase during construction of the revised project (assuming a longer construction schedule) and during operation of the revised project (assuming an increase in building square footage and number of trips to the project site) with the addition of 8,061 square feet of self-storage uses. However, given that the project

characteristics of the revised project (e.g., location, proposed uses) would remain the same as those of the proposed project, the revised project would not conflict with California Air Resources Board's implementation of the Low Carbon Fuel Standard or use of renewable energy sources, the City's Energy Efficiency Climate Action Plan, and it would not conflict with the Southern California Association of Government's 2020–2045 Regional Transportation Plan/Sustainable Communities Strategy.

Therefore, GHG impacts would remain the same as those in the IS/MND.

Noise

While the revised project includes the construction of an additional 8,061 square feet, the construction schedule is assumed to be extended to accommodate the construction of the additional building square footage. However, conservatively, if construction of the 8,061 square feet would occur within the construction schedule assumed in the IS/MND, an increase in the amount of equipment and/or a change in the type of equipment used at a given time is not anticipated such that an increase in A-weighted decibels (dBA) would occur. In addition, the revised project would continue to implement Mitigation Measures MM-NOI-1 and MM-NOI-2.

With regard to operation, on-site noise with the addition of self-storage uses would only marginally change with a potential increase in vehicles driving in the parking area. However, this noise source does not result in a substantial increase in dBA. With regard to off-site traffic noise during operation, as noted above and in the Traffic and Parking Study provided in Attachment A, daily trips would increase by 50 trips. This increase is less than 10 percent of the overall project-generated trips. Even if all of the trips were distributed to the same roadway segment, it would add less than 0.5 dBA to the traffic noise levels. This is a less than perceptible increase.

Therefore, noise impacts would remain the same as those in the IS/MND.

Transportation

Fehr & Peers prepared the Traffic and Parking Study, as provided in Attachment A, that summarizes the findings of a transportation analysis for the revised project. As discussed therein, the revised project would generate 51 additional daily trips. As analyzed in the IS/MND, based on the proposed project characteristics, the proposed project was classified as local-serving retail, which can be screened from a quantitative VMT analysis for CEQA purposes. The revised project would continue to be classified as local-serving retail and no further VMT analysis is required.

Therefore, transportation impacts would remain the same as those in the IS/MND.

Utilities and Service Systems

With regard to water, the construction of an additional 8,061 square feet of building area would marginally increase demand for water during construction should the construction schedule be longer than analyzed in the IS/MND; however, it can be reasonability concluded that this incremental increase would not have an adverse impact on available water supplies as the increase in water demand from construction would be nominal. During operation, as the self-storage buildings would not contain water fixtures, the addition of 8,061 square feet of self-storage uses would not results in an increase in water demand.

Wastewater would not result in wastewater generation as construction workers would utilize portable restrooms, which would not contribute to wastewater flows to the local wastewater system. With regard to wastewater generated during operation, the wastewater generation was based on a factor that included wastewater generation for the self-storage uses. As such, with an increase in self-storage uses, the average daily wastewater generation would increase from 12,250 gallons per day (gpd) to 12,758 gpd. This would be an increase of 508 gpd. While there is an increase in wastewater generation under the revised project, the total wastewater generation would be negligible as compared to the available capacity at the Los Angeles County Sanitation Districts' Joint Water Pollution Control Plant.

With regard to solid waste generated during construction, similar to the proposed project, the revised project would be required to divert 65 percent of solid waste from landfills, the remaining capacity of County-operated landfills would be minimally affected due to construction. With regard to operation, the additional 8,061 square feet of self-storage uses are not anticipated to generate a significant increase in solid waste that would be in excess of State or local standards, or in excess of the capacity of local infrastructure, or otherwise impair the attainment of solid waste reduction goals.

Therefore, utility and service system impacts would remain the same as those in the IS/MND.

Traffic and Parking Study

ESA

FEHR PEERS

Memorandum

Date: September 7, 2022

To: Darren Embry, Faring

From: Drew Heckathorn and Michael Kennedy, Fehr & Peers

Subject: 21611 South Perry Street Self-Storage/Mixed-Use Project Revised Project Description Traffic and Parking Study

LB21-0049

This memorandum summarizes the findings of a traffic and parking study for a revised project description for the 21611 South Perry Street self-storage/mixed-use project (the "Revised Project"). The original project description for the 21611 South Perry Street self-storage/mixed-use project (the "Original Project") was studied and documented in the *21611 South Perry Street – Local Transportation Assessment* report (the "LTA Report") prepared by Fehr & Peers in January 2022.

Revised Project Description

The Revised Project as analyzed in this study involves the construction of:

- 117,100 square feet (1,006 storage units) of self-storage warehouse space
- 2,425 square feet of self-storage office space
- 700 square feet of retail space
- 1,550 square feet of restaurant space

The Revised Project will have the same circulation system and driveway access as the Original Project.

Revised Project Trip Generation

Trip generation rates from *Trip Generation, 11th Edition* (Institute of Transportation Engineers [ITE], 2021) were used to estimate the number of trips associated with the Revised Project and are presented in **Table 1**. The Revised Project will generate 51 additional daily trips, 3 additional trips (1 inbound/2 outbound) during the AM peak hour, and 5 additional trips (3 inbound/2 outbound) during the PM peak hour beyond the trip generation estimated for the Original Project.

Notes:

[a] Source: Institute of Transportation Engineers (ITE), *Trip Generation, 11th Edition* , 2021

[b] The independent variable used to estimate trip generation for the self-storage use is total number of storage units. Trip generation for the self-storage office space is considered to be inclusive, per the ITE approach.

[c] A 0% Walk/Bike/Transit Credit was used based on the site's general suburban context.

[d] ITE use 933 - Fast-Food Restaurant without Drive-Through Window used for daily rate due to lack of daily rate data for ITE use 936 - Coffee/Donut Shop without Drive-Through Window.

[e] ITE use 920 does not have a daily rate. The daily rate is estimated to be 10 times greater than the PM peak hour traffic volume for the use.

Revised Intersection Traffic Analysis

Based on the project trip distribution described in the LTA Report and the additional trips generated by the Revised Project described in the previous section, the only two study intersections estimated to receive more than one additional peak hour trip for any turning movement are the following:

4. Perry Street & Project Driveway
5. Perry Street & Carson Street

Therefore, this revised intersection traffic analysis focuses on these two study intersections to evaluate the traffic operations effect of the additional trips from the Revised Project. **Table 1** summarizes the future LOS at these two study intersections with the addition of the Revised Project trips. Detailed LOS analysis sheets for the Future plus Revised Project scenario are provided as an attachment to this memorandum. These two study intersections are projected to operate at LOS D or better during the morning and evening peak hours under Future plus Revised Project conditions.

Table 1: Future Base and Future Plus Revised Project Levels of Service

Study Intersection	Period	Future Base		Future + Revised Project	
		Delay (s)	LOS	Delay (s)	LOS
4. Perry Street & Project Driveway	AM	Project Only Scenario		9.5	A
	PM			9.4	A
5. Perry Street & Carson Street	AM	21.8	C	31.5	D
	PM	27.2	D	31.9	D

Source: Fehr & Peers.

Revised Queuing Analysis

As shown in the LTA Report, minimal queueing is estimated at the two study intersections included in this Revised Project analysis (Intersections 4 and 5). The additional Revised Project trips are not significant enough to materially contribute to left-turn pocket queuing.

Revised Parking Demand Analysis

Table 2 provides a summary of estimated peak parking demand for the Revised Project using data from the *Parking Generation, Fifth Edition* (ITE, 2019) report. As shown in **Table 2**, the estimated peak parking demand for the Revised Project using the ITE method is 30 spaces. This

finding suggests that the 41 parking spaces proposed for the project will be more than adequate to accommodate peak parking demand for the Revised Project.

Table 2: Peak Parking Demand Estimate – ITE Method

ITE Land Use Code	Equation [2]	Project Size	Project Demand
151 – Mini-Warehouse [1]	P = 0.1x	119,525 SF	12
936 – Coffee/Donut Shop without Drive-Through Window	P = 10.49x	1,550 SF	16
920 – Copy, Print, and Express Ship Store	P = 3.01x	700 SF	2
		Total	**30**

[1] The ITE report specifies Mini-Warehouse to be "typically referred to as 'self-storage' facilities."
[2] P = Parked Vehicles, x = 1,000 square feet increments of gross floor area.
Source: Fehr & Peers.

VMT Analysis

The Revised Project can be classified as local-serving retail, and therefore based on standard OPR guidance can screen out from conducting VMT analysis for CEQA purposes. As described in the OPR technical advisory: "By adding retail opportunities into the urban fabric and thereby improving retail destination proximity, local-serving retail development tends to shorten trips and reduce VMT."

Summary and Conclusions

The following summarizes the results of the Revised Project's traffic and parking study analysis:

- The Revised Project consists of the proposed construction of 117,100 square feet (or 1,006 storage units) of self-storage warehouse space, 2,425 square feet of self-storage office space, 700 square feet of retail space, and 1,550 square feet of restaurant space.

- The Revised Project is expected to generate approximately 51 additional daily trips, 3 additional trips during the AM peak hour, and 5 additional trips during the PM peak hour beyond the trip generation estimated for the Original Project.

- The additional Revised Project trips do not cause average vehicle delay at any study intersection to worsen from LOS D or better to LOS E or F.

- The additional Revised Project trips do not cause spill over queuing at any study intersection.

- Using the ITE method for estimating parking demand, the proposed on-site parking supply of 41 spaces is more than adequate to accommodate the estimated peak parking demand of 30 spaces.

OUR COMMITMENT TO SUSTAINABILITY | ESA helps a variety of public and private sector clients plan and prepare for climate change and emerging regulations that limit GHG emissions. ESA is a registered assessor with the California Climate Action Registry, a Climate Leader, and founding reporter for the Climate Registry. ESA is also a corporate member of the U.S. Green Building Council and the Business Council on Climate Change (BC3). Internally, ESA has adopted a Sustainability Vision and Policy Statement and a plan to reduce waste and energy within our operations. This document was produced using recycled paper.

CHAPTER 1
Introduction

1. Project Title:	21611 Perry Street Self-Storage
2. Lead Agency Name and Address:	City of Carson Community Development Department 701 East Carson Street Carson, CA 90745
3. Contact Person and Phone Number:	Stefanie Edmondson, Senior Planner (310) 952-1761 x1322
4. Project Location:	21611 South Perry Street Carson, CA 90746
5. Project Sponsor's Name and Address:	21611 Perry Street, LLC 4132 Katella Avenue, #205B Los Alamitos, CA 90720
6. General Plan Designation(s):	Light Industrial
7. Zoning:	Manufacturing, Light – with Site Plan and Design Review Overlay (ML-D)

8. Description of Project:

The 21611 Perry Street Self-Storage project (proposed project) is located on a 2.80-acre site at 21611 South Perry Street (project site) in the City of Carson (City). The proposed project includes the development of a self-storage facility with three buildings totaling approximately 113,714 square feet. The self-storage facility would consist of a mix of one- and two-story buildings with a maximum height of 31 feet. The self-storage facility would include a 2,425-square-foot lobby/self-storage office area, a 1,550-square-foot retail use for a cafe, and a 700-square-foot retail use (likely a mail service store such as United Postal Service [UPS] or Federal Express [FedEx]) comprising a total of 4,675 square feet for these uses. The proposed project would provide 41 parking spaces that would be accessed from one driveway providing ingress/egress off South Perry Street. The proposed project would provide approximately 12,134 square feet of landscaping around the perimeter of the project site.

The buildings would house interior climate-controlled storage units and external non-climate-controlled storage units with ramp access to the second floors of the internal buildings. The building's architecture would incorporate a Spanish style with clay tile roofs and neutral toned

stucco. Access to the self-storage facility would be controlled via computerized access gates and would be under digital surveillance 24 hours a day, 7 days a week. The project site is zoned ML-D (Manufacturing, Light – with Site Plan and Design Review Overly) with a General Plan Land Use designation of Light Industrial. The proposed project would require a general plan amendment to allow for a 1:0 Floor Area Ratio (FAR).

9. Surrounding Land Uses and Setting:

The project site is bordered by East Carson Street to the south, South Perry Street to the east, residential uses to the north, and the Dominguez Flood Control Channel (Dominguez Channel) to the west. The project site is in a neighborhood characterized by a mix of residential and commercial uses. An auto repair facility and a truck dealer are located to the east and south across East Carson Street and South Perry Street. Two- and three-story multi-family housing is located directly across South Perry Street to the east with the Perry Mini-Park and single-family homes to the north and northeast of the project site. Additional single-family housing is located southeast of the project site across East Carson Street. The project site is currently vacant and undeveloped.

10. Other public agencies whose approval is required (e.g., permits, financing approval, or participation agreement)**:**

In order for the proposed project to be approved and in compliance with the City's Municipal Code, the Applicant would be required to obtain the following approvals from the City:

- General Plan Amendment (from Light Industrial to Heavy Industrial)
- Zone Change (from Manufacturing Light with a Design Overlay [ML-D] to Perry Street Specific Plan [PSSP])
- Specific Plan Approval
- Development Agreement
- Site Plan/Design Review Overlay
- CEQA Review

11. Have California Native American tribes traditionally and culturally affiliated with the project area requested consultation pursuant to Public Resources Code section 21080.3.1? If so, has consultation begun?

The City notified appropriate tribes regarding Assembly Bill (AB) 52 and Senate Bill (SB) 18 consultation). Refer to Section XVIII, *Tribal Cultural Resources*, for additional information.

Environmental Factors Potentially Affected

The environmental factors checked below would be potentially affected by this project, involving at least one impact that is a "Potentially Significant Impact" as indicated by the checklist on the following pages:

☐ Aesthetics	☐ Agriculture and Forestry Resources	☐ Air Quality
☐ Biological Resources	☐ Cultural Resources	☐ Energy
☐ Geology/Soils	☐ Greenhouse Gas Emissions	☐ Hazards & Hazardous Materials
☐ Hydrology/Water Quality	☐ Land Use/Planning	☐ Mineral Resources
☐ Noise	☐ Population/Housing	☐ Public Services
☐ Recreation	☐ Transportation	☐ Tribal Cultural Resources
☐ Utilities/Service Systems	☐ Wildfire	☐ Mandatory Findings of Significance

Determination

On the basis of this initial study:

☐ I find that the proposed project COULD NOT have a significant effect on the environment, and a NEGATIVE DECLARATION will be prepared.

☒ I find that although the proposed project could have a significant effect on the environment, there will not be a significant effect in this case because revisions in the project have been made by or agreed to by the project proponent. A MITIGATED NEGATIVE DECLARATION will be prepared.

☐ I find that the proposed project MAY have a significant effect on the environment, and an ENVIRONMENTAL IMPACT REPORT is required.

☐ I find that the proposed project MAY have a "potentially significant impact" or "potentially significant unless mitigated" impact on the environment, but at least one effect (1) has been adequately analyzed in an earlier document pursuant to applicable legal standards, and (2) has been addressed by mitigation measures based on the earlier analysis as described on attached sheets. An ENVIRONMENTAL IMPACT REPORT is required, but it must analyze only the effects that remain to be addressed.

☐ I find that although the proposed project could have a significant effect on the environment, because all potentially significant effects (a) have been analyzed adequately in an earlier EIR or NEGATIVE DECLARATION pursuant to applicable standards, and (b) have been avoided or mitigated pursuant to that earlier EIR or NEGATIVE DECLARATION, including revisions or mitigation measures that are imposed upon the proposed project, nothing further is required.

CHAPTER 2
Project Description

2.1 Project Overview

The proposed project is a self-storage facility consisting of approximately 113,714 square feet in a mix of one- and two-story buildings, with a maximum height of 31 feet. The 113,714-square-foot self-storage facility would include a lobby/self-storage office (2,425 square feet), cafe (1,550 square feet), and retail uses (700 square feet) totaling 4,675 square feet.

This Initial Study (IS) serves as the appropriate preliminary environmental documentation in accordance with the California Environmental Quality Act (CEQA) Guidelines to demonstrate the potential environmental impacts associated with the construction and operation of the proposed project. Based on the findings of this IS, the City has determined a Mitigated Negative Declaration (MND) is the appropriate CEQA document for the proposed project.

2.2 Project Location and Existing Setting

The project site is located on the northwest corner of East Carson Street and South Perry Street at 21611 South Perry Street in the City of Carson, California, Los Angeles County. The project site is approximately 2.80 acres (approximately 121,968 square feet) and includes Assessor's Parcel Numbers (APNs) 7327-010-014 and 7327-010-015. Refer to **Figure 2-1**, *Project Site and Regional Location*. The project site is currently one vacant and undeveloped parcel, as shown in **Figure 2-2**, *Aerial Photograph*. The project site was previously improved with a large single-story warehouse building that included commercial/industrial uses. These uses were demolished in 2011. There are no habitable structures present on the project site; however, remnant improvements are still present.

The project site is located in a neighborhood characterized by a mix of residential and commercial uses. A truck dealer is located south of the project site across East Carson Street. An auto repair facility and two- and three-story multi-family residential units are located directly across South Perry Street to the east with the Perry Street Mini-Park and single-family homes located to the north and northeast of the project site. Single-family residential units are located southeast of the project site across East Carson Street. The Dominguez Channel, a 15.7-mile-long drainage channel that runs north-south through the City of Carson, is located to the west of the project site and a flood control easement separates the Dominguez Channel from the project site. The project site is zoned ML-D (Manufacturing, Light – with Site Plan and Design Review Overly) with a General Plan Land Use designation of Light Industrial. The proposed project would require a general plan amendment to allow for a 1:0 FAR.

2.3 Project Site History and Existing Conditions

According to the Phase I Environmental Site Assessment (Phase I ESA), prepared for the project site, there are known groundwater impacts at the project site. In addition, in January 2011, light non-aqueous phase liquid (LNAPL) began appearing within the Dominguez Channel (west of the project site). The LNAPL was reportedly observed entering into channel waters from sediments within the bottom of the channel and within horizontal, perforated sub-drain pipe systems installed within both the west and east channel levees. In April 2011, the Los Angeles Regional Water Quality Control Board (LARWQCB) reportedly issued orders pursuant to Section 13267 of the California Water Code requiring potential responsible parties to assess contaminants of concern impacting soil, soil vapor, and groundwater at the Dominguez Channel and determine the extent that the nearby facilities may have contributed to the release. Upon completion of the required assessments, the LARWQCB determined that the project site (i.e., Carson Air Harbor property), was not a likely contributor to the LANPL release and was granted no further action status relative to the Dominguez Channel issues. However, a separate case for the project site was opened by the LARWQCB (Site Cleanup Program Case No. 0490C) due to other possible sources of contamination. There are 16 groundwater monitoring wells present at the project site that are used as part of the groundwater monitoring program. Primary groundwater contaminants of concern identified in these wells included total petroleum hydrocarbons in the gasoline range, benzene and diisopropyl ether. It was noted that concentrations in existing monitoring wells generally appeared to be stable or decreasing, with a few instances of fluctuation.

To address project site impacts to soil in order to redevelop the project site for commercial/industrial use, a Soil Excavation Workplan was developed by URS and subsequently approved by the LARWQCB on April 21, 2014. Between September 9 and October 8, 2014, 7,255.69 tons (approximately 4,837 in-place cubic yards assuming 1.5 tons per cubic yard) of impacted soil were excavated from the project site and disposed off-site. The impacted soil was removed from four distinct areas to depths ranging from approximately 5 to 8 feet (see Figure 2-5 in Section V, *Cultural Resources*). The excavated areas were then backfilled with imported clean fill or with an approximate 50:50 mix of crushed concrete and imported fill and a small amount of clean overburden soil.

URS concluded that based on confirmation soil sampling for each of the excavations, the cleanup criteria set out in the workplan had been met. URS also stated that a Soil Management Plan (SMP) for the project site was prepared to mitigate potential future exposure to residual petroleum hydrocarbons and odor generation during project site development. URS also stated that a deed restriction limiting project site use to commercial/industrial uses would be required. It was also noted in the report that a vapor barrier would be incorporated in the design of any future structures that are constructed at the project site. URS requested that the LARWQCB issue a no further action letter for vadose zone soils at the project site. The LARWQCB reviewed the report and concurred with its findings. A no further action letter for soil was issued by the LARWQCB on December 14, 2015.

2.4 Project Characteristics

The proposed project is a self-storage facility consisting of approximately 113,714 square feet in a mix of three one- and two-story buildings, with a maximum height of 31 feet. Building A would total 24,808 square feet and would include a lobby/self-storage office and retail uses totaling 4,675 square feet. Specifically, the proposed project would include a 2,425-square-foot space for the lobby/self-storage office area, a 1,550-square-foot space for a cafe use, and a 700-square-foot space for a retail use (likely a mail service store occupied by operators such as UPS or FedEx). Building B would total 30,969 square feet and Building C would total 57,937 square feet. Buildings would house interior climate-controlled units and external non-climate self-storage rental units with ramp access to the second floors of the internal buildings. Ramp access to the second floors would be provided between Buildings B and C. **Figure 2-3**, *Conceptual Site Plan*, provides an illustration of the proposed project. Storage units would range in size from a 5-foot by 10-foot unit as the smallest unit for rent to a 10-foot by 38-foot unit as the largest unit for rent. Fire suppression within the proposed buildings would consist of a National Fire Protection Association (NFPA)-13 sprinkler system as well as surrounding fire hydrants. Construction type is to be Type-II non-combustible.

The proposed project would include approximately 12,134 square feet of landscaping, mostly occurring around the perimeter of the project site. Significant landscaping and plantings would be provided along the project site's northern edge to shield and provide a privacy screen for the residential neighbors. A variety of drought tolerant ornamental shrubs and medium size trees, which would be varying in height, would be included as a part of the proposed landscaping.

Landscape areas would be designed to receive stormwater runoff from the site and mitigate urban heat island effect through vegetated planting areas and tree canopies. The irrigation system would be a fully automatic underground drip system. Backflow prevention devices would be installed to meet all local and City applicable codes. The irrigation system would be designed and constructed to meet and/or exceed Model Water Efficient Landscape Ordinances (MWELO). Water conservation products (High efficiency / low precipitation) and an evapotranspiration (ET) weather-based control system would be incorporated into the irrigation system design.

As shown in **Figure 2-4**, *Conceptual Rendering*, the proposed project would consist of neutral-toned building materials in Spanish styled architecture, which include Spanish accents, Spanish tile roof, spandrel glazing, and landscaping. The proposed design would largely resemble a multi-family residential building in its aesthetics and massing.

As shown in Figure 2-3, the proposed project would include one main entrance to the project site on South Perry Street, which would allow self-storage customers, employees, and mail/delivery trucks such as those used by UPS or FedEx to enter and exit the project site. Specifically, to accommodate the entry to the new storage facility, the existing driveway would be demolished, and a new driveway would be constructed and located near the center of the eastern frontage along South Perry Street. Curb, gutter, sidewalks, and driveway would be designed and constructed with City Engineer review and approval.

ESA

The proposed project would provide 22 public parking spaces outside the gates with an additional 19 spaces provided inside the gates for a total of 41 parking spaces. Of the total parking stalls, two stalls would be included as Americans with Disabilities Act (ADA)-accessible stalls, and seven stalls would be identified to accommodate clean air and/or vanpool EV vehicles.

New lighting would include building identification wayfinding and security lighting. Low emittance lighting would be provided on the walls of the buildings facing the internal drive aisles and mounted at a height of 12 to 13 feet. Pedestrian areas including entryways into the proposed project would be well-lit for security using ground-mounted fixtures. Light fixtures would be shielded and directed towards the areas to be lit and away from light-sensitive residential land uses located to the north and east of the project site. Various features included in the lighting fixtures would also help reduce light trespass including: target zone illumination, photo control occupancy sensing, zero up-light emissions, and best-in-class surge protection.

Proposed signage would include building identification signage, street address, and identification/wayfinding signage for the vehicular and pedestrian entries to the buildings. Signage would comply with City requirements and would not exceed two square feet for every 20 feet of business storefront and 1 square foot for each linear foot that exceeds the first 20 feet. The larger identifying signs would be approximately 26 feet 7.5 inches long and 2 feet 6 inches tall and provided in multiple high-visibility locations along the structure.

The self-storage facility would feature a contemporary 24-hour security system including keypad entry security gates, individually monitored and alarmed storage units, video surveillance monitoring, burglar alarms, as well as an intercom system. The manger and/or other office personnel would monitor these security systems on a control panel during hours of operation. Should there be a violation of any of the security systems when the management office is closed, an independent security firm would respond.

2.5 Project Construction

Project construction is anticipated to start in January 2023, commencing with removal of the existing driveways, followed by approximately 1 month of site preparation. Construction would be completed in 8 phases over an estimated 13-month period and would include the following construction activities: site preparation, grading and excavation, trenching, concrete pouring for the foundation, building construction, paving, architectural coatings and landscaping. Project construction would include the removal of the existing driveways, the excavation of approximately 906 cubic yards of soil and import approximately 257 cubic yards of soil. In addition, the upper 6 feet of existing earth materials within the proposed building footprint areas would be excavated and properly compacted for foundation and slab support.

The proposed project would generate off-site traffic during the initial delivery of construction vehicles and equipment to the project site, the daily arrival, and departure of construction workers, the delivery of materials throughout the construction period, the removal of soil and construction debris and the import of soil. Deliveries would generally include shipments of concrete, lumber,

other building materials for on-site structures, utilities (e.g., plumbing equipment and electrical supplies), and paving and landscaping materials.

2.6 Project Operations

During project operation, the proposed project would include 5 to 6 employees comprising two storage managers, two cafe employees, and one or two employees for the mail service store. Gate access would be provided from 6:00 a.m. to 10:00 p.m., 7 days a week. Management employees would be on-site during regular business hours, which are presumed to be 8 a.m. to 6 p.m., Monday through Sunday. Typical daily operational traffic would be low in frequency and significantly less than other commercial uses, a traditional warehouse, storage, or other manufacturing use. Operational traffic would consist of inbound and outbound delivery trucks and self-storage patrons arriving and departing the project site. Most traffic trips to the project site for the proposed project would occur at hours outside of the peak morning and afternoon commute periods.

2.7 Project Approvals and Discretionary Actions

The proposed project would require the discretionary approvals from the City of Carson City Council, with initial recommendations by the City of Carson Planning Commission. In consideration of the forthcoming General Plan Update, the Applicant will work closely with Planning staff to determine the ideal zoning and land use designations and standards of review. In order for the proposed project to be approved and in compliance with the City's Municipal Code, the Applicant would be required to obtain the following approvals from the City:

- General Plan Amendment (from Light Industrial to Heavy Industrial)
- Zone Change (from Manufacturing Light with a Design Overlay [ML-D] to Perry Street Specific Plan [PSSP])
- Specific Plan Approval
- Development Agreement
- Site Plan / Design Review Overlay
- CEQA Review

CHAPTER 3
Environmental Checklist

I. Aesthetics

Issues (and Supporting Information Sources)	*Potentially Significant Impact*	*Less than Significant with Mitigation Incorporated*	*Less-than-Significant Impact*	*No Impact*
I. AESTHETICS—Except as provided in Public Resources Code Section 21099, would the project:				
a) Have a substantial adverse effect on a scenic vista?	☐	☐	☐	☒
b) Substantially damage scenic resources, including, but not limited to, trees, rock outcroppings, and historic buildings within a State scenic highway?	☐	☐	☐	☒
c) In non-urbanized areas, substantially degrade the existing visual character or quality of public views of the site and its surroundings? (Public views are those that are experienced from publicly accessible vantage point). If the project is in an urbanized area, would the project conflict with applicable zoning and other regulations governing scenic quality?	☐	☐	☒	☐
d) Create a new source of substantial light or glare which would adversely affect daytime or nighttime views in the area?	☐	☐	☒	☐

Discussion

a) The project site is located on one parcel which is currently vacant and undeveloped. According to the City of Carson General Plan EIR, there are no officially designated scenic vistas within Carson (City of Carson 2002). In addition, the project site is within an established a neighborhood characterized by a mix of residential and commercial uses. While the proposed project would develop a currently vacant site, the proposed project would develop similar uses to those in the surrounding area. Therefore, no impacts to a scenic vista would occur.

b) According to the California Department of Transportation (Caltrans), there are no Officially Designated State or County Scenic Highways as defined by Caltrans, the County of Los Angeles, or any other local governing body adjacent to or within the vicinity of the project site (Caltrans 2021). Furthermore, according to the City of Carson General Plan EIR, there are no officially designated scenic vistas or scenic highways within Carson (City of Carson 2002). Therefore, no impact to scenic resources within a State scenic highway would occur.

c) The project site is considered to be located in an urbanized area. The project site is surrounded by urbanized uses. The project site is located in a neighborhood characterized by a mix of residential and commercial uses. A truck dealer is located on south of the project site across East Carson Street. An auto repair facility and two- and three-story

multi-family residential units are located directly across South Perry Street to the east with the Perry Mini-Park and single-family homes located to the north and northeast of the project site. Additional single-family residential units are located southeast of the project site across East Carson Street. The Dominguez Channel, a 15.7-mile-long drainage channel that runs north-south through the City of Carson, is located to the west of the project site and a flood control easement separates the Dominguez Channel from the project site. Given the proposed project's location in an urbanized area, project implementation may result in a significant impact if the proposed project would conflict with applicable zoning and other regulations governing scenic quality.

The project site is designated as Light Industrial land use and zoned as ML-D (Manufacturing, Light – with Site Plan and Design Review Overlay). The proposed project would require a zone change and adoption of a specific plan to allow implementation of the proposed self-storage facility. Approval of the proposed project would require Site Plan and Design review to ensure that the proposed project does not conflict with applicable zoning and other regulations governing scenic quality. The proposed project would be required to comply with City's Industrial Zone Site Development Standards (City of Carson Municipal Code [CMC] Section 9146), which contains building requirements for structures, frontages, and landscaping. As a result, the proposed project would be consistent with the CMC.

The City of Carson's General Plan Land Use Element contains policies and regulations governing scenic quality and visual aesthetics for the City. However, there are no aesthetic related regulations regarding industrial development within the General Plan. The proposed project would be designed to be compatible with zoning and design regulations as detailed in the specific plan and would adhere to all height, frontage, and zoning requirements that may be required to maintain aesthetic compatibility.

As discussed above, the proposed project would consist of neutral-toned building materials in Spanish styled architecture, which include Spanish accents, Spanish tile roof, spandrel glazing, and landscaping. The proposed design would largely resemble a multi-family residential building in its aesthetics and massing. The proposed project would include approximately 12,134 square feet of landscaping around the perimeter of the project site. The proposed design of the self-storage facility and landscaping would provide visual continuity within the area.

Therefore, based on the above, the proposed project would not conflict with zoning or regulations governing scenic quality and impacts would be less than significant.

d) The project site is located within an urbanized area where typical sources from glare are caused by the reflection of sunlight or artificial light by highly polished surfaces such as window glass or reflective materials. In addition, existing residential and commercial uses surrounding the project site typically include nighttime security and wayfinding lighting such that typically emanate from building interiors, passes through windows, and light from outdoor sources, such as street lighting, parking lot lighting, building illumination,

and vehicles. Light-sensitive residential uses are located directly across South Perry Street to the east and to the north and northeast of the project site. Additional light sensitive residential uses are located southeast of the project site across East Carson Street. Implementation of the proposed project would introduce new sources of nighttime lighting onto the project site as a result of installation of new exterior light fixtures that are generally required for security, wayfinding, and aesthetic purposes. Specifically, low emittance lighting would be provided on the walls of the buildings facing the internal drive aisles and mounted at a height of 12 to 13 feet. Pedestrian areas including entryways into the proposed project would be well-lit for security using ground-mounted fixtures. Pursuant to CMC Section 9127.1, all exterior lighting installed on the project site must be directed away from all adjoining and nearby residential property and arranged and controlled so it would not create a nuisance or hazard to traffic or to the living environment. As such, all exterior lighting would be shielded and/or recessed to reduce light trespass (i.e., excessive or unwanted light generated on one property illuminating another property). Therefore, based on compliance with local requirements, impacts associated with light and nighttime glare would be less than significant.

II. Agriculture and Forestry Resources

Issues (and Supporting Information Sources)	Potentially Significant Impact	Less than Significant with Mitigation Incorporated	Less-than-Significant Impact	No Impact
II. AGRICULTURE AND FORESTRY RESOURCES—In determining whether impacts to agricultural resources are significant environmental effects, lead agencies may refer to the California Agricultural Land Evaluation and Site Assessment Model (1997) prepared by the California Department of Conservation as an optional model to use in assessing impacts on agriculture and farmland. In determining whether impacts to forest resources, including timberland, are significant environmental effects, lead agencies may refer to information compiled by the California Department of Forestry and Fire Protection regarding the state's inventory of forest land, including the Forest and Range Assessment Project and the Forest Legacy Assessment project; and forest carbon measurement methodology provided in Forest Protocols adopted by the California Air Resources Board. Would the project:				
a) Convert Prime Farmland, Unique Farmland, or Farmland of Statewide Importance (Farmland), as shown on the maps prepared pursuant to the Farmland Mapping and Monitoring Program of the California Resources Agency, to non-agricultural use?	☐	☐	☐	☒
b) Conflict with existing zoning for agricultural use, or a Williamson Act contract?	☐	☐	☐	☒
c) Conflict with existing zoning for, or cause rezoning of, forest land (as defined in Public Resources Code Section 12220(g)), timberland (as defined by Public Resources Code Section 4526), or timberland zoned Timberland Production (as defined by Government Code Section 51104(g))?	☐	☐	☐	☒
d) Result in the loss of forest land or conversion of forest land to non-forest use?	☐	☐	☐	☒
e) Involve other changes in the existing environment which, due to their location or nature, could result in conversion of Farmland, to non-agricultural use or conversion of forest land to non-forest use?	☐	☐	☐	☒

Discussion

a) The project site is located within the City of Carson on one parcel that is currently vacant and undeveloped. The project site is not zoned for agricultural uses and no agricultural uses or related operations are present on the project site or in the surrounding urbanized area. The project site is not located on designated Prime Farmland, Unique Farmland, or Farmland of Statewide Importance (Farmland) as shown on the maps prepared pursuant to the Farmland Mapping and Monitoring Program (CDC 2021). Therefore, no impact would occur from conversion of Farmland to non-agricultural uses.

b) The project site is located in an urbanized area designated as Light Industrial in the City of Carson's General Plan Land Use Map with a corresponding zoning of ML-D (Manufacturing, Light – with Site Plan and Design Overlay) (City of Carson 2004). No agricultural zoning is present in the project vicinity, and no nearby lands are enrolled under the Williamson Act (CDC 2016). The California Department of Conservation, Division of Conservation, Division of Land Resource Protection does not identify the project site as being protected by the Williamson Act (CDC 2017). As such, the proposed project would not conflict with existing zoning for agricultural uses, or a Williamson Act contract and no impact would occur.

c) As discussed previously, the project site is designated as Light Industrial on the City of Carson's General Land Plan Land Use Map and is zoned ML-D (Manufacturing, Light – with Site Plan and Design Review Overlay) (City of Carson 2004). The project site includes one parcel that is currently vacant and undeveloped within an urbanized area. No forestland or timberland uses are located in the project site's urban setting or vicinity. Therefore, no impact would occur to zoning for forestland or timberland.

d) As discussed above, the project site is zoned for industrial uses and the surrounding areas are zoned for residential and commercial uses. No forestland or timberland uses are located at the project site or within the vicinity. Therefore, no impact would occur to forestland or timberland.

e) As discussed above, the proposed project would not involve changes to the existing environment that could result in the conversion of farmland or forestland and there are no farmland uses on or in the vicinity of the project site. Therefore, no impact would occur from a conversion of farmland to a non-agricultural use.

III. Air Quality

Issues (and Supporting Information Sources)	Potentially Significant Impact	Less than Significant with Mitigation Incorporated	Less-than-Significant Impact	No Impact
III. AIR QUALITY—Where available, the significance criteria established by the applicable air quality management district or air pollution control district may be relied upon to make the following determinations. Would the project:				
a) Conflict with or obstruct implementation of the applicable air quality plan?	☐	☐	☒	☐
b) Result in a cumulatively considerable net increase of any criteria pollutant for which the project region is non-attainment under an applicable federal or State ambient air quality standard?	☐	☐	☒	☐
c) Expose sensitive receptors to substantial pollutant concentrations?	☐	☐	☒	☐
d) Result in other emissions (such as those leading to odors adversely affecting a substantial number of people?	☐	☐	☒	☐

Discussion

a) *Regulatory Background*

The proposed project is located within the 6,745-square-mile South Coast Air Basin (Basin). Air quality planning for the Basin is under the jurisdiction of the South Coast Air Quality Management District (SCAQMD). SCAQMD is the agency principally responsible for comprehensive air pollution control in the Basin. The Basin is subject to the SCAQMD's Air Quality Management Plan (AQMP), which was created to meet the to meet the California Ambient Air Quality Standards (CAAQS) and National Ambient Air Quality Standards (NAAQS) for criteria air pollutants. The AQMP contains a comprehensive list of pollution control strategies directed at reducing emissions from stationary sources and on-road and off-road mobile sources and achieving ambient air quality standards. These strategies are developed, in part, based on regional population, housing, and employment projections prepared by the Southern California Association of Governments (SCAG). As part of its air quality planning, SCAG has prepared the Regional Comprehensive Plan (RCP) and Guide and the Regional Transportation Program/Sustainable Communities Strategy (RTP/SCS), these plans provide the basis for the land use and transportation components of the AQMP and are used in the preparation of the air quality forecasts and the consistency analysis included in the AQMP.[1] Both the RCP and AQMP are based, in part, on projections originating with County of Los Angeles and City of Carson general plans. The proposed project would be subject to the SCAQMD's AQMP.

The SCAQMD's 2016 AQMP was prepared to accommodate growth, reduce the high levels of pollutants within the areas under the jurisdiction of SCAQMD, return clean air to the region, and minimize the impact on the economy (SCAQMD 2016). The SCAQMD is required, pursuant to the Clean Air Act, to reduce emissions of criteria pollutants for which

[1] The most recent version of the AQMP (2016 AQMD) is based on the 2016-2040 RTP/SCS and will therefore rely on the 2016-2040 RTP/SCS when discussing plan consistency.

the Basin is in non-attainment for the NAAQS (e.g., ozone [O_3], and particulate matter 2.5 microns in diameter or less [PM2.5]). Projects that are consistent with the assumptions used in the AQMP do not interfere with attainment because the associated growth with the projects are included in the projections utilized in the formulation of the AQMP. Projects that are consistent with the projections of employment and population forecasts identified in the RTP/SCS are considered consistent with the AQMP growth projections, since the RTP/SCS forms the basis of the land use and transportation control portions of the AQMP. The SCAQMD's 2016 AQMP contains a comprehensive list of pollution control strategies directed at reducing emissions and achieving the NAAQS and includes transportation control strategies designed to reduce vehicle miles traveled (VMT). SCAQMD's 2016 AQMP control strategies were developed, in part, based on regional growth projections prepared by SCAG through 2040. When determining consistency with AQMP growth assumptions, the projections in the AQMP for achieving air quality goals are based on assumptions in SCAG's 2016-2040 RTP/SCS regarding population, housing, and growth trends. Determining whether or not a project exceeds the assumptions reflected in the AQMP involves the evaluation of consistency with applicable population, housing, and employment growth projections and appropriate incorporation of AQMP control measures. While SCAG's Regional Council adopted the 2020–2045 RTP/SCS on September 3, 2020, SCAQMD's 2016 AQMP is based on growth projections and control strategies from the 2016–2040 RTP/SCS. The SCAQMD is currently working on a 2022 AQMP, which will base its analyses on the 2020–2045 RTP/SCS. However, until the 2022 AQMP is adopted, consistency with the 2016–2040 SCAG RTP/SCS is appropriate when discussing a project's consistency with the SCAQMD's 2016 AQMP.

The proposed project's consistency with applicable air quality plans is provided below. There are no applicable numerical thresholds of significance for this consistency analysis. In accordance with the SCAQMD's CEQA Air Quality Handbook, the following criteria were used to evaluate the proposed project's consistency with the SCAQMD's 2016 AQMP:

- Criterion 1: Will the project result in any of the following:
  - An increase in the frequency or severity of existing air quality violations; or
  - Cause or contribute to new air quality violations; or
  - Delay timely attainment of air quality standards or the interim emission reductions specified in the AQMP.
- Criterion 2: Will the project exceed the assumptions utilized in preparing the AQMP?

The proposed project's potential impacts with respect to these criteria are discussed to assess the consistency with the SCAQMD's 2016 AQMP.

Criterion 1

Consistent with the first criterion, the proposed project would not conflict with the ability of federal, State, and local agencies to implement fair-share emissions strategies or achieve compliance with criteria pollutant standards or other federal requirements. Specifically, the

proposed project's volatile organic compound (VOC), nitrogen oxides (NO_X), carbon monoxide (CO), sulfur dioxide (SO_2), respirable particulate matter (10 microns or smaller in diameter, PM10), and fine particulate matter (2.5 microns or smaller in diameter, PM2.5) emissions resulting from construction and operation were analyzed to ascertain any potential effects on regional and localized concentrations and determine the potential for such emissions to cause or contribute to a violation of the ambient air quality standards. As discussed under response to Section III (b) and response to Section III (c), the proposed project's construction and operational emissions would not exceed the SCAQMD's regional mass emissions thresholds for VOC, NO_X, CO, SO2, PM10 or PM2.5 or the localized significance thresholds (LSTs) for NO_X, CO, PM10 or PM2.5, or generate roadway traffic congestion at an intersection that would result in a CO hotspot in excess of the ambient air quality standards as a result of project motor vehicle operations. The proposed project's emissions would therefore not increase concentrations of criteria pollutants or their precursors in a manner that would conflict with or obstruct SCAQMD's efforts to achieve attainment of ambient air quality standards for any criteria pollutant for which it is currently not in attainment or jeopardize the current attainment status of the Basin for other criteria pollutants. Therefore, in response to Criterion 1, the proposed project would not result in an increase in the frequency or severity of existing air quality violations, cause or contribute to new air quality violations, or delay timely attainment of air quality standards or the interim emissions reductions specified in the AQMP.

Criterion 2

With respect to the second criterion for determining consistency with AQMP growth assumptions, the projections in the AQMP for achieving air quality goals are based on assumptions in SCAG's 2016–2040 RTP/SCS regarding population, housing, and growth trends. Determining whether or not a project exceeds the assumptions reflected in the AQMP involves the evaluation of consistency with applicable population, housing, and employment growth projections and appropriate incorporation of AQMP control measures. The following discussion provides an analysis with respect to these criteria.

Air Quality Management Plan Consistency

The proposed project would not obstruct implementation of the 2016 AQMP for, as discussed below, its construction and operational emissions would be less than significant. The proposed project would comply with applicable required fleet rules and control strategies to reduce on-road truck emissions (i.e., 13 California Code of Regulations, Section 2025 [CARB Truck and Bus regulation]), and other applicable SCAQMD rules specified and incorporated in the 2016 AQMP. As discussed above, projects, uses, and activities that are consistent with the applicable growth projections and control strategies used in the development of the AQMP would not jeopardize attainment of the air quality levels identified in the AQMP. As discussed below, compliance with the applicable required fleet rules and control strategies and requirements would render it consistent with, and meet or exceed, the AQMP requirements for control strategies intended to reduce emissions from construction equipment and activities. Thus, the proposed project's criteria pollutant emissions would not cause the Basin's criteria pollutant emissions to worsen so as to impede the SCAQMD's efforts to achieve attainment with respect to any criteria

pollutant for which it is currently not in attainment of the NAAQS and CAAQS (e.g., ozone, PM10, and PM2.5),[2] or to cause the Basin to deteriorate from its current attainment status with respect to any other criteria pollutant emissions.

As further discussed below, the proposed project is also consistent with the 2016 AQMP. The proposed project incorporates into its design appropriate control strategies set forth in the 2016 AQMP for achieving its emission reduction goals and would be consistent with the demographic and economic assumptions upon which the plan is based.

Construction

Control Strategies

During its construction phase, the proposed project would ensure compliance with CARB's requirements to minimize short-term emissions from on-road and off-road diesel equipment, and with SCAQMD's regulations such as SCAQMD Rule 403 for controlling fugitive dust and SCAQMD Rule 1113 for controlling VOC emissions from architectural coatings. Compliance with these regulatory measures and requirements would be consistent with and meet or exceed the AQMP requirements for control strategies intended to reduce emissions from construction equipment and activities.

Growth Projections

The proposed project would generate short-term construction jobs, but these jobs would not necessarily bring new construction workers or their families into the region, since construction workers are typically drawn from an existing regional pool who travel among construction sites within the region. Construction workers are not typically brought from other regions to work on developments such as the proposed project. Moreover, these jobs would be relatively small in number and temporary in nature. Therefore, the proposed project's construction jobs would not conflict with the long-term employment or population projections upon which the 2016 AQMP is based.

Operations

Control Strategies and Policy Consistency

The 2016 AQMP was prepared to accommodate growth, reduce the levels of pollutants within the areas under the jurisdiction of SCAQMD, return clean air to the region, and minimize the impact on the economy. Projects that are considered consistent with the AQMP would not interfere with attainment because this growth is included in the projections used in the formulation of the AQMP. As mentioned above, for determining consistency with AQMP growth assumptions, the projections in the AQMP for achieving air quality goals are based on assumptions in SCAG's 2016-2040 RTP/SCS regarding population, housing, and employment growth trends.

[2] The Los Angeles County portion of the Basin is designated as nonattainment for the federal lead standard; however, this was due to localized emissions from two lead-acid battery recycling facilities in the City of Vernon and the City of Industry that are no longer operating. For reference refer to South Coast Air Quality Management District, Board Meeting, Agenda No. 30, Adopt the 2012 Lead State Implementation Plan for Los Angeles County, May 4, 2012.

The project site is zoned Manufacturing, Light – with Site Plan and Design Review Overlay with a General Plan land use designation of Light Industrial. The proposed project includes three two-story self-storage buildings with a total of approximately 113,714 square feet. The proposed project includes a 2,425-square-foot lobby/office area, 1,550 square feet to be used as a cafe area, and a 700-square-foot space for a mail service store (i.e., UPS or FedEx). The buildings would house interior climate-controlled units and external non-climate units with ramp access to the second floors of the internal buildings. The project site is in a neighborhood characterized by a mix of residential and commercial uses with single-family residences located to the north of the project site. An auto repair facility and a truck dealer are located on the east and south across East Carson Street and South Perry Street. The Perry Mini-Park and single-family homes are located to the northeast of the project site. Additional single-family housing is located southeast of the project site across East Carson Street.

Growth Projections

The proposed project would generate approximately five or six new employees, including two self-storage managers, two cafe employees, and one or two employees for the mail service store. These new employees are well within SCAG's employment growth assumptions for Carson. SCAG predicted Carson's employment growth between 2012 and 2040 to be 11,200 jobs (SCAG 2016). During each operation day, the proposed project has a maximum of 580 daily vehicle trips, which would include up to 93 AM peak hour trips, and 45 PM peak hour trips from employees and visitors to and from the project site (Fehr & Peers 2022). As discussed in Section XVII, *Transportation*, this proposed project does not have a significant impact on transportation. Mobile source emissions associated with the project site were calculated and are discussed in Threshold b, below.

Projects, uses, and activities that are consistent with the applicable growth projections and control strategies used in the development of the AQMP would not jeopardize attainment of the air quality reductions identified in the AQMP. Based on the above, the proposed project would not conflict with growth projections in the 2016 AQMP and impacts would be less than significant.

b) As indicated above, the project site is in the South Coast Air Basin. State and federal air quality standards are exceeded in many parts of the Basin for ozone (O_3) and PM2.5, including those monitoring stations nearest to the project area, and the Basin is designated a State and federal non-attainment area for these pollutants. The Basin is also designated as a State non-attainment area for PM10. The proposed project would contribute to local and regional air pollutant emissions during construction (short-term or temporary) and operation. However, based on the following analysis, construction and operation of the proposed project would result in less-than-significant impacts relative to the daily significance thresholds for criteria air pollutant emissions established by the SCAQMD for construction and operational phases.

Daily regional construction and operational source project ozone precursor and criteria pollutant emissions such as VOC, NO_X, CO, SO_2, PM10, and PM2.5 were estimated using

the California Emissions Estimator Model (CalEEMod) (Version 2020.4.0) software, an emissions inventory software program recommended by SCAQMD. CalEEMod is based on outputs from the CARB OFFROAD model and the CARB on-road vehicle emissions factor (EMFAC) model, which are emissions estimation models developed by CARB and used to calculate emissions from construction activities, heavy-duty off-road equipment, and on-road vehicles. Emissions from on-road vehicles were estimated outside of CalEEMod using EMFAC2021 emission factors for haul and material vendor trucks and worker vehicles, since the most current version of CalEEMod uses EMFAC2017. Activities parameters, such as number of pieces of equipment and equipment usage hours were provided by the Applicant.

Construction

Construction activities associated with the proposed project would generate temporary and short-term emissions of VOC, NO_X, CO, SO_2, PM10, and PM2.5. Construction related emissions are expected from site preparation, grading, trenching, foundations, paving, building construction, and architectural coating activities. During the site preparation approximately 150 cubic yards (cy) of concrete/asphalt debris would be generated. During the grading phase approximately 906 cy of soil would be generated with approximately 257 cy being imported as fill. Project construction is expected to commence in January 2023 and would last through February 2024. If project construction commences later than the anticipated start date, air quality impacts would be less than those analyzed herein, because a more energy-efficient and cleaner burning construction equipment fleet mix would be expected in the future, pursuant to State regulations that require construction equipment fleet operators to phase-in less polluting heavy-duty equipment. Therefore, air quality impacts would generally be less than those analyzed herein due to the likelihood of less emissions generated in a day.

The duration of construction activity and associated equipment represents a reasonable approximation of the expected construction fleet as required per CEQA guidelines. Site specific construction fleet may vary due to specific project needs at the time of construction. The duration of construction activity and associated construction equipment was estimated based on consultation with the Applicant. A detailed summary of construction equipment assumptions by phase is provided in the modeling files in **Appendix A** of this IS/MND.

Construction of the proposed project is estimated to last approximately 13 months. Construction duration by phase is provided in **Table 1**, *Estimated Construction Schedule*.

The maximum daily regional emissions from these activities are estimated by construction phase and compared to the SCAQMD significance thresholds. Maximum daily emissions are calculated by taking the sum of the overlapping phases for each criteria pollutant. As shown in **Table 2**, *Maximum Regional Construction Emissions – Without Mitigation (Pounds per Day)*, emissions resulting from project construction would not exceed any criteria pollutant thresholds established by the SCAQMD (SCAQMD 2015). Therefore, impacts would be considered less than significant, and no mitigation is required.

TABLE 1
ESTIMATED CONSTRUCTION SCHEDULE

Activity	Start Date	End Date	Duration (Work Days)
Site Preparation	01/2023	02/2023	23

Operation

The proposed project is a self-storage facility with ancillary office and retail uses. The proposed project would include a surface parking lot with 41 parking spaces. During operation of the proposed project, the primary emission sources would consist of mobile sources, including visitors loading and unloading to the storage units, visitors traveling to and from the retail uses, and employees driving to and from the project site. Energy usage would come in the form of electricity and natural gas for building heating, ventilation, and air conditioning (HVAC) systems, lighting, cooking in the cafe, and area sources such as landscaping equipment and the use of consumer products for routine cleaning and maintenance. The proposed project can expect most of the energy usage to come from lighting and the HVAC system required to provide air conditioning of the building.

Operational emissions for the proposed project were estimated using CalEEMod for the land uses that would be developed under the proposed project (2024 project buildout) (refer to **Appendix A** of this IS/MND for compiled detailed assumptions, calculations, and modeling outputs). Mobile source emissions are based on the vehicle emission factors from EMFAC2021 and the default trip length values for the project land uses in CalEEMod, which are Air District-wide average trip distance values. Daily trip generation from the proposed project's Local Transportation Assessment (LTA), provided in **Appendix L** of this IS/MND, were used to estimate the total VMT for the project trips (Fehr & Peers 2022).

The proposed project would also include landscaping equipment such as lawnmower and trimmers to maintain the approximately 12,134 square feet of landscaping proposed around the perimeter of the project site. The CalEEMod tool uses landscaping equipment greenhouse gas (GHG) emission factors from the CARB OFFROAD model and the CARB Technical Memo: Change in Population and Activity Factors for Lawn and Garden Equipment (CARB 2003). The CalEEMod software estimates that landscaping equipment operate for 250 days per year in the Basin. Emissions of VOCs from the use of consumer products and architectural coatings are based on SCAQMD-specific emission factors for land uses in the Basin.

Operational-source emissions are summarized in **Table 3**, *Maximum Unmitigated Regional Operational Emissions (Pounds per Day)*. As shown, project operational-source emissions are below the applicable SCAQMD regional thresholds of significance (SCAQMD 2015). Therefore, impacts would be considered less than significant, and no mitigation is required.

The SCAQMD's approach for assessing cumulative impacts related to operations is based on attainment of ambient air quality standards in accordance with the requirements of the federal and California Clean Air Acts. As discussed earlier, the SCAQMD has developed a comprehensive plan, the 2016 AQMP, which addresses the region's cumulative air quality condition.

SOURCE: ESA 2022

A significant impact may occur if a project were to add a cumulatively considerable contribution of a federal or State non-attainment pollutant. The Basin is currently in non-attainment for ozone (federal and State standards), PM10 (State standards only) and PM2.5 (federal and State standards); therefore, related projects could cause ambient concentrations to exceed an air quality standard or contribute to an existing or projected air quality exceedance. Cumulative impacts to air quality are evaluated under two sets of thresholds for CEQA and SCAQMD. In particular, CEQA Guidelines Section 15064(h)(3) provides guidance in determining the significance of cumulative impacts. Specifically, CEQA Guidelines Section 15064(h)(3) states in part that:

> *A lead agency may determine that a project's incremental contribution to a cumulative effect is not cumulatively considerable if the project will comply with the requirements in a previously approved plan or mitigation program which provides specific requirements that will avoid or substantially lessen the cumulative problem (e.g., water quality control plan, air quality plan, integrated waste management plan) within the geographic area in which the project is located. Such plans or programs must be specified in law or adopted by the public agency with jurisdiction over the affected resources through a public review process to implement, interpret, or make specific the law enforced or administered by the public agency …*

For purposes of the cumulative air quality analysis with respect to CEQA Guidelines Section 15064(h)(3), the proposed project's incremental contribution to cumulative air quality impacts is determined based on compliance with the SCAQMD adopted 2016 AQMP. As discussed previously under Section III (a) above, the proposed project would be consistent with the 2016 AQMP and would not have a cumulatively considerable air quality impact. Although the proposed project's employment would increase compared to existing conditions, this growth would be well within the employment projections for the City.

As the proposed project is not part of an ongoing regulatory program, the SCAQMD also recommends that project-specific air quality impacts be used to determine the potential cumulative impacts to regional air quality. As shown in **Table 2** and **Table 3**, peak daily emissions of construction and operation-related pollutants would not exceed SCAQMD regional significance thresholds. By applying SCAQMD's cumulative air quality impact methodology, even though implementation of the proposed project would result in an addition of criteria pollutants, in conjunction with related projects in the region, cumulatively significant impacts would not occur. Therefore, the emissions of non-attainment pollutants and precursors generated by the proposed project would be less than significant and would not result in a cumulatively considerable air quality impact.

c) According to the SCAQMD CEQA Air Quality Handbook, sensitive receptors include residences, schools, playgrounds, childcare centers, athletic facilities, long-term health care facilities, rehabilitation centers, convalescent centers, and retirement homes.

The localized effects from the on-site portion of the emissions were evaluated at nearby sensitive receptor locations potentially impacted by the proposed project according to the SCAQMD's Localized Significance Threshold Methodology (June 2003, revised July 2008), which relies on on-site mass emission rate screening tables and project-specific dispersion modeling, which may be used for sites greater than 5 acres or for projects that exceed the screening tables, as appropriate (SCAQMD 2008). LSTs represent the maximum emissions from a project site that are not expected to result in an exceedance of a NAAQS or CAAQS.

The LSTs are applicable to NO_X, CO, PM10, and PM2.5. For NO_X and CO, the thresholds are based on the ambient air quality standards. For PM10 and PM2.5, the thresholds are based on requirements in SCAQMD Rule 403 (Fugitive Dust) for construction and Rule 1303 (New Source Review Requirements) for operations. The SCAQMD has established screening criteria that can be used to determine the maximum allowable daily emissions that would satisfy the LSTs and, therefore, not cause or contribute to an exceedance of the applicable ambient air quality standards without project-specific dispersion modeling. The screening criteria depend on: (1) the area in which the project is located, (2) the size of the project area, and (3) the distance between the project area and the nearest sensitive receptor (e.g., residences, schools, hospitals). For the proposed project, the appropriate Source Receptor Area (SRA) for the LSTs is the South Los Angeles County Coastal monitoring station (SRA 4). The nearest sensitive receptors to the proposed project are the residential uses located 50 feet to the north of the project site. Since the total acreage disturbed is less than 5 acres, the LST analysis were based on the SCAQMD's look-up tables for a 2.80-acre site in SRA 4 with sensitive receptors located 25 meters (82 feet) from the project site (June 2003, revised July 2008).[3]

[3] SCAQMD's Localized Significance Threshold Methodology (refer to page 3-3) states for project boundaries located closer than 25 meters (82 feet) to the nearest receptor, such as the proposed project where the nearest receptors are located approximately 50 feet to the north of the project site, should use the LSTs for receptors located at 25 meters.

The localized effects from the on-site portion of the proposed project's daily emissions were evaluated at the sensitive receptor locations that would be potentially impacted by the proposed project according to the SCAQMD's LST methodology. SCAQMD's Methodology clearly states that "off-site mobile emissions from the project should not be included in the emissions compared to LSTs." Therefore, for purposes of the LST analysis, only emissions included in the CalEEMod "on-site" emissions outputs were considered, plus the truck idling emissions (e.g., haul trucks and vendor trucks) that were calculated separately using the EMFAC emission factors for heavy-heavy-duty (HHD) vehicles. Daily localized emissions caused by the proposed project were compared to the LSTs in the SCAQMD's look-up tables to determine whether the emissions would cause violations of ambient air quality standards.

Construction Emissions

Localized Construction Emissions

Table 4, *Maximum Daily Localized Construction Emissions*, presents the localized emissions from on-site equipment during the construction of the proposed project, located 25 meters (82 feet) north of the project site, in the vicinity of the project area without mitigation.

TABLE 4
MAXIMUM DAILY LOCALIZED CONSTRUCTION EMISSIONS

	Emissions (pounds per day)			
Year	**NO_X**	**CO**	**PM10**	**PM2.5**

Based on the results summarized in Table 4, the unmitigated project impacts would not exceed the LSTs.

Operational Emissions

According to SCAQMD LST methodology, LSTs would apply to the operational phase of a project, if the project includes stationary sources, or attracts mobile sources. With regard to on-site sources of emissions, the proposed project would generate emissions from area sources located on-site such as natural gas combustion from water heaters, cooking stoves, landscaping equipment, and use of consumer products. **Table 5**, *Maximum Daily Localized Operational Emissions*, presents the localized emissions from on-site equipment during the operation of the proposed project.

TABLE 5

CO "Hot Spot" Analysis

A CO hotspot is an area of localized CO pollution that is caused by severe vehicle congestion on major roadways, typically near intersections. While construction-related traffic on the local roadways would occur during construction, the net increase of construction worker vehicle trips to the existing daily traffic volumes on the local roadways would be relatively small and would not result in CO hotspots. Additionally, the construction-related vehicle trips would be short-term, and ceased once construction activities are completed. During operation, as presented in the proposed project's LTA, the proposed project would include a total of 580 trips to the project site per day. Overall, the proposed project would not cause or contribute to the formation of CO hotspots based on the AQMP's 2003 study, which estimates 100,000 vehicles per day could cause the formation of a CO hotspot (SCAQMD 2003a). Therefore, impacts would be less than significant.

Toxic Air Contaminants

Concentrations of toxic air contaminants (TACs), or in federal parlance, hazardous air pollutants (HAPs), are also used as indicators of ambient air quality conditions. A TAC is defined as an air pollutant that may cause or contribute to an increase in mortality or in serious illness, or that may pose a hazard to human health. TACs are usually present in

minute quantities in the ambient air; however, their high toxicity or health risk may pose a threat to public health even at low concentrations.

Intermittent construction activities associated with the proposed project would result in short-term emissions of diesel particulate matter, which the State has identified as a TAC. During construction, the exhaust of off-road heavy-duty diesel equipment would emit diesel particulate matter (DPM) during general construction activities, such as excavation, materials transport and handling, and building construction. During operational activities DPM would be emitted by the diesel trucks traveling to, on, and from the project site.

Diesel particulate matter poses a carcinogenic health risk that is generally measured using an exposure period of 30 years for sensitive residential receptors, according to the California Environmental Protection Agency, Office of Environmental Health Hazard Assessment (OEHHA) Air Toxics Hot Spots Program Guidance Manual for Preparation of Health Risk Assessments (OEHHA Guidance), which was updated in 2015 with new exposure parameters including age sensitivity factors (OEHHA 2015). Sensitive receptors include residential uses located approximately 50 feet north of the project site, the Perry Street Mini-Park located approximately 100 feet to the northeast, residences located approximately 65 feet east and additional residences located approximately 252 feet southeast of the project site across East Carson Street.

Construction

Temporary TAC emissions associated with DPM emissions from heavy construction equipment would occur during construction activities. According to OEHHA and the SCAQMD's Health Risk Assessment Guidance for Analyzing Cancer Risks from Mobile Source Diesel Idling Emissions for CEQA Air Quality Analysis, (SCAQMD 2003b) health effects from TACs are described in terms of individual cancer risk based on a lifetime (i.e., 70-year) resident exposure duration. Given the temporary and short-term construction schedule (approximately 13 months), the proposed project would not result in a long-term (i.e., lifetime or 70-year) exposure as a result of construction activities.

The proposed project would be consistent with the applicable 2016 AQMP requirements for control strategies intended to reduce emissions from construction equipment and activities. The proposed project would comply with regulatory control measures including the CARB Air Toxics Control Measure (ATCM) that limits diesel powered equipment and vehicle idling to no more than 5 minutes at a location, and the CARB In-Use Off-Road Diesel Vehicle Regulation that requires fleets to retire, replace, or repower of older, dirtier engines with newer emission-controlled models; compliance with these would minimize emissions of TACs during construction. SCAQMD recommends that construction health risk assessments be conducted for substantial sources of DPM emissions (e.g., earth-moving construction activities) in proximity to sensitive receptors and has provided guidance for analyzing mobile source diesel emissions. Although, sensitive receptors, including single-residential uses, are located to the north of the project site, localized DPM emissions (strongly correlated with PM2.5 emissions) are less than significant (as shown in Table 4, above). Although the localized analysis does not directly measure health risk

impacts, it does provide data that can be used to evaluate the potential to cause health risk impacts. The low level of PM2.5 emissions coupled with the relatively short-term duration of construction activity anticipated at 13 months resulted in an overall low level of DPM concentrations in the project area. Furthermore, compliance with the aforementioned CARB ATCM anti-idling measure further minimizes DPM emissions in the project area. Thus, although there are sensitive receptors located within proximity to the project site, compliance with regulatory control measures and the limited duration of construction activities would minimize exposures.

Operations

SCAQMD recommends that health risk assessments be conducted for substantial sources of operational DPM emissions (e.g., truck stops and warehouse distribution facilities that generate more than 100 trucks per day or more than 40 trucks with operating transport refrigeration units) and has provided guidance for analyzing mobile source diesel emissions (SCAQMD 2003b). During operational activities DPM would be emitted by the diesel trucks traveling to, on, and from the site. However, the land uses that would be developed under the proposed project are not considered a substantial source of operational DPM as described by the SCAQMD. Therefore, the project operations associated with the storage facility or retail uses would generate only minor amounts of diesel emissions from mobile sources, such as delivery/box trucks and occasional maintenance activities that would not exceed 100 trucks per day or more than 40 trucks with operating transport refrigeration units. Furthermore, project trucks would be required to comply with the applicable provisions of the CARB 13 California Code of Regulations, Section 2025 (Truck and Bus regulation) to minimize and reduce PM and NO_X emissions from existing diesel trucks. Therefore, project operations would not be considered a substantial source of diesel particulates. Furthermore, typical sources of hazardous TACs include industrial manufacturing processes and automotive repair facilities. The proposed project would not include any of these potential sources, although minimal emissions may result from the use of consumer products (e.g., aerosol sprays). Project operations would only result in minimal emissions of toxic air contaminants from the use of architectural coatings and other products. The use of consumer products and architectural coatings from the office use would be expected to generate minimal emissions. The proposed project's land uses would not include installation of industrial-sized equipment (i.e., paint booths) or require extensive use of commercial or household cleaning products. Based on this, the proposed project is not expected to release substantial amounts of TACs.

Therefore, based on the limited activity of TAC sources and TAC concentrations at off-site sensitive receptors relative to existing conditions, the proposed project would not warrant the need for a health risk assessment associated with on-site activities, and potential TAC impacts would be less than significant.

d) Potential sources that may emit odors during construction activities include construction equipment exhaust and the use of architectural coatings and solvents. According to the SCAQMD CEQA Air Quality Handbook, construction equipment is not a typical source of odors. SCAQMD Rule 1113 limits the amount of VOCs from architectural coatings and

solvents. Further, construction odor emissions would be temporary, short-term, and intermittent in nature and would cease upon completion of construction. Through adherence with mandatory compliance with SCAQMD Rules, no construction activities or materials would create objectionable odors. The nearest sensitive receptors are single-family residences located approximately 50 feet to the north of the project site along East 215th Place. The proposed project's uses would not typically generate nuisance odors at nearby sensitive receptors.

According to the SCAQMD CEQA Air Quality Handbook, land uses associated with odor complaints typically include agricultural uses, wastewater treatment plants, food processing plants, chemical plants, composting operations, refineries, landfills, dairies, and fiberglass molding facilities. The proposed project does not include any of the land uses associated with odor complaints.

Furthermore, as discussed in Thresholds b and c, above, construction and operational emissions would not exceed the SCAQMD regional significance thresholds for attainment, maintenance, or unclassifiable criteria air pollutants (i.e., CO and SO_2).

Therefore, impacts related to other emissions, including those that would lead to odors adversely affecting a substantial number of people, would be less than significant.

IV. Biological Resources

Issues (and Supporting Information Sources)	*Potentially Significant Impact*	*Less than Significant with Mitigation Incorporated*	*Less-than-Significant Impact*	*No Impact*
IV. BIOLOGICAL RESOURCES—Would the project:				
a) Have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special-status species in local or regional plans, policies, or regulations, or by the California Department of Fish and Game or U.S. Fish and Wildlife Service?	☐	☐	☒	☐
b) Have a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, regulations, or by the California Department of Fish and Game or U.S. Fish and Wildlife Service?	☐	☐	☐	☒
c) Have a substantial adverse effect on state or federally protected wetlands (including, but not limited to, marsh, vernal pool, coastal, etc.) through direct removal, filling, hydrological interruption, or other means?	☐	☐	☐	☒
d) Interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites?	☐	☒	☐	☐
e) Conflict with any local policies or ordinances protecting biological resources, such as a tree preservation policy or ordinance?	☐	☐	☐	☒
f) Conflict with the provisions of an adopted Habitat Conservation Plan, Natural Community Conservation Plan, or other approved local, regional, or state habitat conservation plan?	☐	☐	☐	☒

This section is based in part on the 21611 Perry Street Self Storage Project Memorandum (Biological Resources Memorandum), prepared by Environmental Science Associates (ESA), dated December 2021 (refer to **Appendix B** of this IS/MND).

Discussion

a) The project site is located within the City of Carson in an urbanized area on one parcel, which is currently vacant and undeveloped. The project site consists of sparse ruderal vegetation with plantings of carrotwood (*Cupaniopsis anacardioides*) as street trees along South Perry Street. A California Natural Diversity Database (CNDDB) and California Native Plant Society (CNPS) Online Inventory of Rare and Endangered Plants records search was conducted for the project site and the results are summarized in the Biological Resources Memorandum. As discussed therein, the project site does not contain suitable habitat for any species identified as a candidate, sensitive, or special-status species in local or regional plans, policies, or regulations, or by the California Department of Fish and Game or U.S. Fish and Wildlife Project. The Biological Resources Memorandum found that only two special-status plant species were determined to have a low potential to occur within the project site. Therefore, less than significant impacts to candidate, sensitive, or special-status species would occur, and no mitigation measures are required.

b) The project site and surrounding area are located in an urbanized setting. There are no drainage channels on the project site to the adjacent Dominguez Channel. In addition, the project site does not contain riparian habitat and there are no other sensitive natural

communities as indicated in the City or regional plans or in regulations by the California Department of Fish and Wildlife (CDFW) or U.S. Fish and Wildlife Service (USFWS). Therefore, no impact would occur to riparian habitat or a natural community.

c) As discussed above, in the response to Threshold (a), the project site is located in an urbanized area on one parcel, which is currently vacant and undeveloped. The surrounding area has been fully developed with urban uses and associated infrastructure. The project site does not contain any wetlands as defined by Clean Water Act Section 404. Thus, because the project site does not contain any wetland features no impact would occur.

d) The project site is located within the City of Carson in an urbanized area on one parcel, which is currently vacant and undeveloped. As described above under response to Threshold (a), above, the project site consists of sparse ruderal vegetation with plantings of carrotwood (*Cupaniopsis anacardioides*) as street trees along South Perry Street. The street tree, which are not native or protected as defined by CMC Section 3901, may be removed as part of this proposed project. However, these street trees have the potential to provide suitable nesting habitat for migratory birds and raptors protected under the Federal Migratory Bird Treaty Act (MBTA) and the California Fish and Game Code. The MBTA and California Fish and Game Code prohibit the take or destruction of migratory birds/raptors, their nests, and/or eggs. Impacts on nesting birds protected by the MBTA and similar provisions of the Fish and Game Code could occur if work is conducted during the breeding season (February 1 through August 15). However, the proposed project would adhere to all existing laws and regulations, including compliance with the MBTA as provided in Mitigation Measure MM-BIO-1, which would minimize any potential impacts to migratory birds or raptors as a result of tree removal.

In addition, due to the urbanized nature of the project site and surrounding area, the lack of a major water body, and the lack of natural open space area on the project site, the project site does not otherwise contain substantial habitat for native resident or migratory species, or native nursery sites. Therefore, the proposed project would not interfere with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites, and no impact would occur. Mitigation Measure MM-BIO-1 is identified to ensure that potentially significant impacts to migratory birds or raptors are reduced to a less-than-significant level.

Mitigation Measure

MM-BIO-1. Pre-construction (vegetation removal) avian nesting surveys shall be conducted during the breeding season. A qualified avian biologist shall conduct these surveys within 7 days of vegetation and tree removal. The surveying biologist must be qualified to determine the species, status, and nesting stage without causing intrusive disturbance. The survey shall cover all reasonably potential nesting locations on and within 300 feet of the project site. If active nests are found, a no-disturbance buffer (300 feet for raptors and 50 feet for other birds, or as otherwise determined in consultation with CDFW shall be created around the active nests. If construction is scheduled to occur during the

non-nesting season (August 16 to January 31), no preconstruction surveys or additional measures are required.

e) As discussed above, the project site is located in an urbanized area of the City of Carson in an urbanized area, on one parcel, which is currently vacant and undeveloped. The potential removal of the non-protected and non-native existing street trees would occur in compliance with all existing laws and regulations, including the MBTA. Thus, the proposed project would not interfere with local biological preservation policies or ordinances and no impact would occur.

f) As discussed above, the project site is located in an urbanized area of the City of Carson on one parcel, which is currently vacant and undeveloped. No candidate, sensitive, or special-status species habitats occur on or in proximity to the project site. The project site is not located within an area designated within a habitat conservation plan, natural community conservation plan, or other approved local, regional, or State habitat conservation plan (CDFW 2022). Thus, the proposed project would not conflict with the provisions of any adopted conservation plan and no impact would occur.

V. Cultural Resources

Issues (and Supporting Information Sources)	*Potentially Significant Impact*	*Less than Significant with Mitigation Incorporated*	*Less-than-Significant Impact*	*No Impact*
V. CULTURAL RESOURCES—Would the project:				
a) Cause a substantial adverse change in the significance of a historical resource pursuant to §15064.5?	☐	☐	☐	☒
b) Cause a substantial adverse change in the significance of an archaeological resource pursuant to §15064.5?	☐	☒	☐	☐
c) Disturb any human remains, including those interred outside of formal cemeteries?	☐	☒	☐	☐

This section is based on the 21611 Perry Street Self Storage, Cultural Resources Assessment Report, located in **Appendix C** of this IS/MND. Appendix C is confidential and not for public distribution.

Discussion

a) A historical resource is defined in CEQA Guidelines Section 15064.5(a)(3) as any object, building, structure, site, area, place, record, or manuscript determined to be historically significant or significant in the architectural, engineering, scientific, economic, agricultural, educational, social, political, military, or cultural annals of California. Historical resources are further defined as those associated with significant events, important persons, or distinctive characteristics of a type, period or method of construction; representing the work of an important creative individual; or possessing high artistic values. Resources listed in or determined eligible for the California Register, included in a local register, or identified as significant in a historic resource survey are also considered historical resources under CEQA. The site is currently one vacant parcel and therefore no historic-age architectural resources exist within the project site; therefore, the proposed project would have no direct impact on known historical resources. No known significant archaeological resources that could be historical resources under CEQA are known to exist within the project site. The potential for impacts to significant archaeological resources is further addressed below in Section V (b). The records search revealed that one cultural resource has been previously recorded within the 0.5-mile radius of the project site. This resource is a historic-period built environmental resource consisting of the Shell Oil Refinery complex located approximately 0.20 miles north of the project site. The record search results did not indicate that any recorded historical resources were located in the immediate project vicinity, and no structures meeting the 45-year California Office of Historic Preservation (OHP) threshold for historic resources were found in the immediate vicinity of the project site. As such, the proposed project would not have indirect impacts to any known historical resources. The adjacent Dominguez Channel is listed in the Built Environment Resources Directory (BERD) for potential eligibility as a District. There was no additional information available on the District. However, the proposed project would not impact the Dominguez Channel or related flood control components such as access roads as there would not be any project components within these areas. Further, as described above, the project site was formerly developed with a large single-story warehouse building that included

commercial/industrial uses next to the Dominguez Channel and the proposed project would have a similar development consisting of a mix of one- and two-story buildings of similar size and massing to the former development, which was present after the channel was developed until the warehouse complex was demolished in 2011, and did not impact the Dominguez Channel's potential eligibility (refer to Appendix C of this IS/MND). The channel passes through a heavily developed urban and industrial area and the addition of the proposed project would not change the landscape surrounding the Dominguez Channel and would not impact the potential eligibility of a District nor would it impact the portion of the channel that passes by the project site. Therefore, no impact would occur.

b) CEQA Guidelines Section 15064.5(a)(3)(D) generally defines archaeological resources as any resource that "has yielded, or may be likely to yield, information important in prehistory or history." Archaeological resources are features, such as tools, utensils, carvings, fabric, building foundations, etc., that document evidence of past human endeavors and that may be historically or culturally important to a significant earlier community.

A records search for the project site was received from the South Central Coastal Information Center (SCCIC) on December 7, 2021. The records search included a review of all recorded archaeological resources and previous studies within a 0.5-mile radius of the project site. The records search results indicate five cultural resources studies have been conducted within the records search radius. The entirety of the 0.5-mile records search radius has been included in previous cultural resources studies. Of the five previous studies, one (LA-04512) overlaps the entirety of the project site. This study is a cultural resources inventory of the City conducted in 1977 and included extensive archival research and field survey of accessible parcels within the City. In reviewing the report, it is difficult to discern if the project site was included as part of the inventory's field survey. The records search revealed that one cultural resource (P-19-188395) has been previously recorded within the 0.5-mile radius of the project site. This resource is a historic-period built environment resource consisting of the Shell Oil Refinery complex located approximately 0.20 miles north of the project site. No resources have been recorded within the project site. A survey of the project site further did not result in the recordation of any additional resources.

The project site has been subject to a number of previous disturbances, which is reflected by the presence of artificial fill as identified as a result of geotechnical borings. Additionally, a remediation program was carried out in 2014 to remediate 7,255.69 tons of contaminated soil from four discrete locations within the project site (**Figure 2-5,** *Remediation Areas*). These four areas were excavated to depths ranging from 5 to 8 feet deep to remove petroleum hydrocarbons and volatile organic compounds from the project site. Following the removal of the contaminated soils, the excavated areas were backfilled with imported clean fill or with a mix of crushed concrete and imported fill. Project-related ground disturbance within the artificial fill is not likely to encounter subsurface archaeological resources; however, there may exist pockets of undisturbed sediments within the project site, outside of the remediation areas or below the remediation areas that may contain subsurface archaeological deposits.

Figure 2-5
Remediation Areas

ESA

Should these potential deposits be present they may qualify as historical resources or unique archaeological resources pursuant to CEQA.

In order to avoid significant impacts to any historical or unique archaeological resources that may be present, it is recommended that an archaeological monitor be present during initial ground-disturbing activities, including grubbing and other methods of de-vegetation, in order to assess surface and subsurface conditions outside or below the remediation areas. Based on observations made by the archaeological monitor, monitoring activities may be modified or discontinued at the recommendation of the archaeologist. Additionally, it is recommended that protocols for work stoppage in the event that archaeological resources or human remains are encountered during construction should be implemented.

Based on these results, Mitigation Measure MM-CULT-1 is identified to ensure that potentially significant impacts to archaeological resources are reduced to a less-than-significant level.

Mitigation Measure

MM-CULT-1. Prior to issuance of demolition permit, the Applicant shall retain a qualified Archaeologist who meets the Secretary of the Interior's Professional Qualifications Standards (Qualified Archaeologist) to oversee an archaeological monitor who shall be present during construction excavations such as demolition, clearing/grubbing, grading, trenching, or any other construction excavation activity associated with the proposed project that occur outside or below the remediation areas. The frequency of monitoring shall be based on the rate of excavation and grading activities, proximity to known archaeological resources, the materials being excavated (younger alluvium vs. older alluvium), and the depth of excavation, and if found, the abundance and type of archaeological resources encountered, as determined by the Qualified Archaeologist. Full-time field observation can be reduced to part-time inspections or ceased entirely if determined appropriate by the Qualified Archaeologist. Prior to commencement of excavation activities, an Archaeological and Cultural Resources Sensitivity Training shall be given for construction personnel. The training session, shall be carried out by the Qualified Archaeologist and shall focus on how to identify archaeological and cultural resources that may be encountered during earthmoving activities and the procedures to be followed in such an event.

In the event that historic or prehistoric archaeological resources (e.g., bottles, foundations, refuse dumps, Native American artifacts or features, etc.) are unearthed, ground-disturbing activities shall be halted or diverted away from the vicinity of the find so that the find can be evaluated. An appropriate buffer area shall be established by the Qualified Archaeologist around the find where construction activities shall not be allowed to continue. Work shall be allowed to continue outside of the buffer area. All archaeological resources unearthed by project construction activities shall be evaluated by the Qualified Archaeologist and a Gabrieleño Band of Mission Indians – Kizh Nation Monitor. If the resources are Native American in origin, the Kizh Nation shall consult with the City and Qualified Archaeologist regarding the treatment and curation of any prehistoric archaeological resources. If a resource is determined by the Qualified Archaeologist to constitute a "historical resource" pursuant to CEQA Guidelines Section 15064.5(a) or a "unique archaeological resource" pursuant to Public Resources Code Section 21083.2(g), the Qualified Archaeologist shall coordinate with the Applicant and the City to develop a

formal treatment plan that would serve to reduce impacts to the resources. The treatment plan established for the resources shall be in accordance with CEQA Guidelines Section 15064.5(f) for historical resources and Public Resources Code Section 21083.2(b) for unique archaeological resources. The treatment plan shall incorporate the Kizh Nation's treatment and curation recommendations. Preservation in place (i.e., avoidance) is the preferred manner of treatment. If preservation in place is not feasible, treatment may include implementation of archaeological data recovery excavations to remove the resource along with subsequent laboratory processing and analysis. The treatment plan shall include measures regarding the curation of the recovered resources that may include curation at a public, non-profit institution with a research interest in the materials, such as the Natural History Museum of Los Angeles County or the Fowler Museum, if such an institution agrees to accept the material and/or the Kizh Nation. If no institution or the Kizh Nation accepts the resources, they may be donated to a local school or historical society in the area (such as the Culver City Historical Society) for educational purposes.

Prior to the release of the grading bond, the Qualified Archaeologist shall prepare a final report and appropriate California Department of Parks and Recreation Site Forms at the conclusion of archaeological monitoring. The report shall include a description of resources unearthed, if any, treatment of the resources, results of the artifact processing, analysis, and research, and evaluation of the resources with respect to the California Register of Historical Resources and CEQA. The report and the Site Forms shall be submitted by the Applicant to the City, the South Central Coastal Information Center, and representatives of other appropriate or concerned agencies to signify the satisfactory completion of the proposed project and required mitigation measures.

c) The California Native American Heritage Commission (NAHC) was contacted on November 2, 2021, to request a search of the Sacred Lands File (SLF). The NAHC responded to the request in a letter dated December 16, 2021, with the results of the SLF search conducted by the NAHC, which indicated a negative search result. The NAHC provided a list of tribes who could be contacted for information regarding known and recorded sites.

Archival research did not reveal any evidence that human remains could be found at the project site or in the area adjacent to the project site. Even so, construction of the proposed project could potentially disturb previously unknown human remains. Implementation of Mitigation Measures MM-CULT-2 and MM-CULT-3 would ensure impacts related to the discovery of human remains would be reduced to a less than significant level.

Mitigation Measure

MM-CULT-2. If human remains are encountered unexpectedly during implementation of the proposed project, State Health and Safety Code Section 7050.5 requires that no further disturbance shall occur until the County Coroner has made the necessary findings as to origin and disposition pursuant to Public Resources Code Section 5097.98. If the remains are determined to be of Native American descent, the coroner has 24 hours to notify the NAHC. The NAHC shall then identify the person(s) thought to be the Most Likely Descendent (MLD). The MLD may, with the permission of the land owner, or his or her authorized representative, inspect the site of the discovery of the Native American remains and may recommend to the owner or the person responsible for the excavation work means for treating or disposing, with appropriate dignity, the human remains and any associated grave goods.

The MLD shall complete their inspection and make their recommendation within 48 hours of being granted access by the land owner to inspect the discovery. The recommendation may include the scientific removal and nondestructive analysis of human remains and items associated with Native American burials. Upon the discovery of the Native American remains, the landowner shall ensure that the immediate vicinity, according to generally accepted cultural or archaeological standards or practices, where the Native American human remains are located, is not damaged or disturbed by further development activity until the landowner has discussed and conferred, as prescribed in this mitigation measure, with the MLD regarding their recommendations, if applicable, taking into account the possibility of multiple human remains. The landowner shall discuss and confer with the descendants all reasonable options regarding the descendants' preferences for treatment.

If the NAHC is unable to identify a MLD, or the MLD identified fails to make a recommendation, or the landowner rejects the recommendation of the MLD and the mediation provided for in Public Resources Code Section 5097.94, subdivision (k), if invoked, fails to provide measures acceptable to the landowner, the landowner or his or her authorized representative shall inter the human remains and items associated with Native American human remains with appropriate dignity on the facility property in a location not subject to further and future subsurface disturbance.

MM-CULT-3. In the case of human remains findings (as mitigated under MM-CULT-2), should the remains be determined to be Native American and should the Kizh Nation be recommended by the NAHC as Most Likely Descendant (MLD), then the following policy shall apply. Should the Kizh Nation not be named MLD by the NAHC other procedures may be required by the assigned MLD. As the MLD, the Koo-nas-gna Burial Policy shall be implemented. To the Kizh Nation, the term "human remains" encompasses more than human bones. In ancient as well as historic times, Tribal Traditions included, but were not limited to, the preparation of the soil for burial, the burial of funerary objects with the deceased, and the ceremonial burning of human remains. If the discovery of human remains includes four or more burials, the discovery location shall be treated as a cemetery and a separate treatment plan shall be created. The prepared soil and cremation soils are to be treated in the same manner as bone fragments that remain intact. Associated funerary objects are objects that, as part of the death rite or ceremony of a culture, are reasonably believed to have been placed with individual human remains either at the time of death or later; other items made exclusively for burial purposes or to contain human remains can also be considered as associated funerary objects. Cremations will either be removed in bulk or by means as necessary to ensure complete recovery of all sacred materials. In the case where discovered human remains cannot be fully documented and recovered on the same day, the remains will be covered with muslin cloth and a steel plate that can be moved by heavy equipment placed over the excavation opening to protect the remains. If this type of steel plate is not available, a 24-hour guard should be posted outside of working hours. The Kizh Nation will make every effort to recommend diverting the project and keeping the remains in situ and protected. If the project cannot be diverted, it may be determined that burials will be removed. In the event preservation in place is not possible despite good faith efforts by the project applicant/developer and/or landowner, before ground-disturbing activities may resume on the project site, the landowner shall arrange a designated site location within the footprint of the project for the respectful reburial of the human remains and/or ceremonial objects. Each occurrence of human remains and associated funerary objects will be stored using opaque cloth bags. All human remains, funerary objects, sacred objects and objects of cultural patrimony will be removed to a secure container on-site if possible. These items should be retained and reburied within 6 months of recovery. The

site of reburial/repatriation shall be on the project site but at a location agreed upon between the Kizh Nation and the landowner at a site to be protected in perpetuity. There shall be no publicity regarding any cultural materials recovered. The Kizh Nation will work closely with the project's qualified archaeologist to ensure that the excavation is treated carefully, ethically and respectfully. If data recovery is approved by the Kizh Nation, documentation shall be prepared and shall include (at a minimum) detailed descriptive notes and sketches. All data recovery data recovery-related forms of documentation shall be approved in advance by the Kizh Nation. If any data recovery is performed, once complete, a final report shall be submitted to the Kizh Nation and the NAHC. The Kizh Nation does NOT authorize any scientific study or the utilization of any invasive and/or destructive diagnostics on human remains.

VI. Energy

Issues (and Supporting Information Sources)	*Potentially Significant Impact*	*Less than Significant with Mitigation Incorporated*	*Less-than-Significant Impact*	*No Impact*
VI. ENERGY—Would the project:				
a) Result in potentially significant environmental impact due to wasteful, inefficient, or unnecessary consumption of energy resources, during project construction or operation?	☐	☐	☒	☐
b) Conflict with or obstruct a State or local plan for renewable energy or energy efficiency?	☐	☐	☒	☐

Discussion

a) The proposed project would consume energy during construction activities primarily from on- and off-road vehicle fuel consumption in the form of diesel and gasoline and electricity from water conveyance for dust control. Project operation would consume energy from energy use from general building operations, including HVAC systems and lighting, and from mobile sources. The analysis below includes the proposed project's energy requirements and energy use efficiencies by energy type for each stage of the proposed project (construction and operations).

Construction

Construction of the proposed project would result in energy demand primarily from off-road equipment and on-road vehicle fuel consumption (diesel and gasoline) and secondarily from electricity for conveying water used for dust suppression and for a temporary on-site construction office/trailer. The analysis below includes the proposed project's energy requirements and energy use efficiencies by energy type for each stage of the proposed project.

The estimated fuel usage for off-road equipment is based on the number and type of equipment that would be used during construction activities, hour usage estimates, the total duration of construction activities, and hourly equipment fuel consumption factors from the California Air Resources Board (CARB) OFFROAD model, which was used in the proposed project's air quality analysis. On-road vehicles would include trucks to haul material to and from the project site, vendor trucks to deliver supplies necessary for project construction, water trucks for dust control, and fuel used for employee commute trips. The estimated fuel usage for on-road vehicles is based on the number of trucks and employee commute trips that would occur during construction activities and per mile fuel consumption factors from the CARB on-road vehicle emissions factor (EMFAC) model, which was used in the proposed project's air quality analysis. Electricity used for a portable construction office was calculated using energy intensity factors from CalEEMod and electricity from water conveyance for dust control was calculated using assumptions for gallons used per acre per day and CalEEMod water conveyance intensity factors applied to calculate total construction electricity consumption. Construction activities typically do not involve the consumption of natural gas. **Table 6**, *Summary of Energy Consumption*

During Project Construction, summarizes the proposed project's total and annual fuel and electricity consumption from construction activities.

TABLE 6
SUMMARY OF ENERGY CONSUMPTION DURING PROJECT CONSTRUCTION

Fuel Type	Quantity
Gasoline	gallons
On-Road Construction (Workers)	18,942
Total Gasoline (13 months)	
Diesel	gallons
On-Road Construction Equipment	4,132
Off-Road Construction Equipment	83,758
Total Diesel (13 months)	***87,890***
Electricity	MWh
Water Conveyance for Dust Control	3.5
Total Electricity (13 months)	3.5
Annualized Gasoline Use (gal)	**17,459**
Annualized Diesel Use (gal)	**81,010**
Annualized Electricity (MWh)	**3.5**

NOTES:
gal = gallons; MWh = megawatt-hours
SOURCE: ESA 2022

As shown in Table 6**,** annual average construction electricity usage would be approximately 3.5 megawatt-hours (MWh). This amount is within the supply and infrastructure capabilities of Southern California Edison (SCE), the electricity provider for the project site, which had a net energy load of 87,143 gigawatt-hours (GWh) in 2020 (SCE 2019).[4] The electricity demand at any given time would vary throughout the construction period based on the construction activities being performed, and would cease upon completion of construction. Electricity use from construction would be short-term, limited to working hours, used for necessary construction-related activities, and represent a small fraction of the proposed project's annual operational electricity. Construction electricity usage of the proposed project would consume approximately 0.004 percent of SCE's total load and would not cause additional strain on SCE's electricity load. When not in use, electric equipment would be powered off so as to avoid unnecessary energy consumption. Furthermore, the electricity used for off-road light construction equipment would have the co-benefit of reducing construction-related air pollutant and GHG emissions from more traditional construction-related energy in the form of diesel fuel. Therefore, impacts from construction electrical demand would be less than significant and would not result in the wasteful, inefficient, and unnecessary consumption of energy.

4 The most recent year that SCE data was available.

The energy use summary provided above in Table 6 represents the amount of energy that could potentially be consumed during project construction based on a conservative set of assumptions, provided in **Appendix D** of this IS/MND. As shown, on- and off-road vehicles would consume an estimated annual average of 17,459 gallons of gasoline and approximately 81,010 gallons of diesel fuel throughout the proposed project's construction. For comparison purposes, the fuel usage during project construction would represent approximately 0.00015 percent of the 2020 annual on-road gasoline-related energy consumption and 0.005 percent of the 2019 annual diesel fuel-related energy consumption in California.

Operations

During operation of the proposed project, energy would be consumed for multiple purposes, including, but not limited to HVAC equipment, lighting, and the use of electronics. Energy would also be consumed during project operations related to water usage, solid waste disposal, and vehicle trips. **Table 7**, *Project Operational Energy Usage*, summarizes the proposed project's operational energy consumption.

TABLE 7
PROJECT OPERATIONAL ENERGY USAGE

Energy Type[a]	Annual Quantity[b]
Electricity	
Proposed Project:	
Building Energy	530 MWh
Water Conveyance	353 MWh
Total Electricity	***883 MWh***
Natural Gas	
Proposed Project:	
Building Energy	0.46 million cf
Total Natural Gas	***0.46 million cf***
Transportation	
Proposed Project:	
Gasoline	44,972 gallons
Diesel	4,509 gallons
Natural Gas	71 gallons
Total Transportation – Gasoline	***44,972 gallons***
Total Transportation – Diesel	***4,509 gallons***
Total Transportation – Natural Gas	***71 gallons***

NOTES:
MWh = megawatt-hours; million cf = million cubic feet
Detailed calculations are provided in **Appendix D** of this IS/MND.
[a] Project electricity and natural gas estimates assume compliance with applicable 2019 Title 24 and CALGreen requirements.
[b] Totals may not add up due to rounding of decimals.
SOURCE: ESA 2022

The proposed project would increase demand for electricity including what is needed to support building operations. As shown in Table 7, the proposed project would result in an annual consumption of electricity of approximately 883 MWh per year, which would represent approximately 0.001 percent of SCE's total sales of 87,143 GWh in 2020 (SCE 2019).

The proposed project has been evaluated for consistency with the Energy Efficiency Climate Action Plan (EECAP). According to the EECAP, the City is in the process of implementing strategies to reduce energy consumption across sections, which includes promoting commercial energy retrofits, increasing energy efficiency through water efficiency, and decreasing energy demand through reducing the urban heat island effect (City of Carson 2015). Consistent with this strategy, the proposed project would install lighting and a ventilation system that conforms to the CALGreen Code and 2019 Title 24 Standards. In addition, the proposed project would include approximately 12,134 square feet of landscaping around the perimeter of the project site. These features would be consistent with energy reduction strategies in the City's EECAP. Therefore, with the incorporation of these features, operation of the proposed project would not result in the wasteful, inefficient, and unnecessary consumption of electricity, and impacts would be less than significant.

The proposed project would increase the demand for natural gas resources. As shown in Table 7, the proposed project's estimated operational natural gas demand is 0.46 million cubic feet, which represents 0.019 percent of Southern California Gas Company's (SoCalGas's) projected supply of 2,462 million cubic feet in 2024 (California Gas and Electric Utilities 2020). As would be the case with electricity, the proposed project would comply with the applicable provisions of Title 24, City of Carson's EECAP, and the CALGreen Code in effect at the time of building occupancy to minimize natural gas demand. As such, the proposed project would minimize energy demand. Therefore, with the incorporation of these features, operation of the proposed project would not result in the wasteful, inefficient, and unnecessary consumption of natural gas, and impacts would be less than significant.

The proposed project would increase demand for transportation fuels relative to existing site conditions for gasoline and diesel. During daily operations, the proposed project would have a maximum of 580 vehicle trips. The proposed project's annual gasoline consumption would be approximately 44,972 gallons, which represents 0.001 percent of Los Angeles County's 2019 consumption of 3.6 billion gallons (CEC 2019). The proposed project's annual diesel consumption would be approximately 4,509 gallons, which represents 0.001 percent of Los Angeles County's 2019 consumption of 584.7 million gallons (CEC 2019).

The project site is one vacant parcel that consists of approximately 2.8 acres located to the east of Interstate (I)-405 interchange with East Carson Street. The project site is located adjacent to a variety of existing transportation facilities. The proposed project does not propose to change any roadway classifications or established truck routes. The project site

is served by one public transit route, Long Beach Transit Route 4, which provides connections to the Los Angeles Metropolitan Transportation Authority (Metro) J Line bus rapid transit at Carson Station and the Metro A Line light rail at Del Amo Station. Implementation of the proposed project would not remove or impede access to existing bicycle facilities, sidewalks, or transit services adjacent to the project site, nor would it affect future planned bicycle facility improvements along other nearby roadways or the Dominguez Channel.

Based on the proposed project characteristics, it is classified as local-serving retail pursuant to the Technical Advisory on Evaluating Transportation Impacts in CEQA (Office of Planning and Research 2018). As described in the Technical Advisory, "By adding retail opportunities into the urban fabric and thereby improving retail destination proximity, local-serving retail development tends to shorten trips and reduce VMT." Based on the above, operation of the proposed project would not result in the wasteful, inefficient, and unnecessary consumption of transportation fuel, and impacts would be less than significant.

b) The proposed project would use construction contractors who demonstrate compliance with applicable regulations. Construction equipment would comply with federal, State, and regional requirements where applicable. With respect to truck fleet operators, the USEPA and NHSTA have adopted fuel efficiency standards for medium- and heavy-duty trucks. The Phase 1 heavy-duty truck standards apply to combination tractors, heavy-duty pickup trucks and vans, and vocational vehicles for model years 2014 through 2018 and result in a reduction in fuel consumption from 6 to 23 percent over the 2010 baseline, depending on the vehicle type (USEPA 2011). USEPA and NHTSA also adopted the Phase 2 heavy-duty truck standards, which cover model years 2021 through 2027 and require the phase-in of a 5 to 25 percent reduction in fuel consumption over the 2017 baseline depending on the compliance year and vehicle type (USEPA 2016). The energy modeling for trucks does not take into account specific fuel reductions from these regulations, since they would apply to fleets as they incorporate newer trucks meeting the regulatory standards; however, these regulations would have an overall beneficial effect on reducing fuel consumption from trucks over time as older trucks are replaced with newer models that meet the standards.

In addition, construction equipment and trucks are required to comply with CARB regulations regarding heavy-duty truck idling limits of 5 minutes at a location and the phase-in of off-road emission standards that result in an increase in energy savings in the form of reduced fuel consumption from more fuel-efficient engines. Although these regulations are intended to reduce criteria pollutant emissions, compliance with the anti-idling and emissions regulations would also result in the efficient use of construction-related energy.

The State and the City have implemented energy policies relevant to the proposed project. The California Renewables Portfolio Standard (RPS) was established in 2002 and required retail sellers of electricity, including investor-owned utilities and community choice aggregators, to provide at least 20 percent of their supply from renewable sources by 2013. Senate Bill (SB) 350 (Chapter 547, Statues of 2015) is the most recent update to the State's

RPS requirements. The RPS requires publicly owned utilities and retail sellers of electricity in California to procure 33 percent of their electricity sales from eligible renewable sources by 2020 and 50 percent by the end of 2030. The proposed project would comply with the applicable provisions of the 2019 Title 24 standards and the CALGreen Code in effect at the time of building permit issuance. As of February 2019, the City receives electricity from Clean Power Alliance (CPA) and is enrolled in their 50 percent renewable electricity option. Customers have the choice to opt for a lower renewable energy mix (36 percent), opt for a higher renewable energy mix (100 percent), or opt out and receive electricity from SCE (CPA 2018). The energy analysis conservatively assumes the proposed project would remain with SCE as their electricity provider and does not take additional credit for renewable energy beyond the expected SCE renewable energy percentage for year 2024 based on the required renewables by year 2024 under SB 100.[5] Therefore, the electricity provided to the City meets or exceeds RPS requirements depending on what rate option is chosen by individual customers.

As discussed above, the proposed project would comply with the applicable provisions of 2019 Title 24 Standards, City of Carson's EECAP, and the CALGreen Code in effect at the time of building occupancy. As such, the proposed project would minimize energy demand. Further, as discussed in Section III, *Air Quality*, of this IS/MND, SCAG predicted Carson's employment growth between 2012 and 2040 to be approximately 11,200 new jobs (SCAG 2020). The estimated five or six new employees generated by the proposed project would be well within SCAG's employment growth assumptions for Carson. As discussed in Section XVII, *Transportation*, of this IS/MND, the proposed project would not have a significant impact on transportation in the project vicinity. Additionally, the project site is located in a neighborhood characterized by a mix of residential and commercial uses. The proposed project is consistent with SCAG growth projections and would comply with State and local regulations to reduce energy consumption, the proposed project would not conflict with or obstruct a State or local plan for renewable energy or energy efficiency and impacts would be less than significant.

---

[5] For the purposes of estimating energy demand, the analysis conservatively assumes the proposed project would not switch electricity providers from SCE to the CPA (i.e., does not take any credit for 36 percent, 50 percent, or 100 percent renewable electricity, depending on the selected CPA plan). Should the proposed project switch electricity providers from SCE to the CPA, the proposed project's electricity-related emissions would be lower than those disclosed in this section.

VII. Geology and Soils

Issues (and Supporting Information Sources)	*Potentially Significant Impact*	*Less than Significant with Mitigation Incorporated*	*Less-than-Significant Impact*	*No Impact*
VII. GEOLOGY AND SOILS—Would the project:				
a) Directly or indirectly cause potential substantial adverse effects, including the risk of loss, injury, or death involving:				
i) Rupture of a known earthquake fault, as delineated on the most recent Alquist-Priolo Earthquake Fault Zoning Map issued by the State Geologist for the area or based on other substantial evidence of a known fault? (Refer to Division of Mines and Geology Special Publication 42.)	☐	☐	☒	☐
ii) Strong seismic ground shaking?	☐	☐	☒	☐
iii) Seismic-related ground failure, including liquefaction?	☐	☐	☒	☐
iv) Landslides?	☐	☐	☐	☒
b) Result in substantial soil erosion or the loss of topsoil?	☐	☐	☒	☐
c) Be located on a geologic unit or soil that is unstable, or that would become unstable as a result of the project, and potentially result in on- or off-site landslide, lateral spreading, subsidence, liquefaction, or collapse?	☐	☐	☒	☐
d) Be located on expansive soil, as defined in Table 18-1-B of the Uniform Building Code (1994), creating substantial direct or indirect risks to life or property?	☐	☐	☒	☐
e) Have soils incapable of adequately supporting the use of septic tanks or alternative waste water disposal systems where sewers are not available for the disposal of waste water?	☐	☐	☐	☒
f) Directly or indirectly destroy a unique paleontological resource or site or unique geologic feature?	☐	☐	☐	☒

This section is based in part on the Geotechnical Investigation, Proposed Commercial Development 21611 South Perry Street, Carson, California, APN: 7327-010-014 (Geotechnical Investigation), prepared by Geocon West, Inc., dated April 23, 2021 (refer to **Appendix E** of this IS/MND). Additionally, this section is based on the Paleontological Resources Assessment Report, prepared by ESA, dated January 2022 (refer to **Appendix F** of this IS/MND). Appendix F is confidential and not for public distribution.

Discussion

a.i) The project site is located in the seismically active Southern California Region; however, it is not within an Alquist-Priolo Zone. The City's General Plan Regional Fault Map indicates that the project site is within the Avalon-Compton fault zone, which is part of the larger Newport Inglewood fault zone (City of Carson 2004). The Avalon-Compton fault zone is located approximately 2.69 miles north of the project site; however, as stated in the City's General Plan and the California Geological Survey (CGS 2021), surface faulting is not considered a significant potential hazard for properties located within the City.

Furthermore, the proposed project's building design and construction would be required to conform to the current seismic design provisions of the City's Building Code, which incorporates relevant provisions of the 2019 California Building Code (CBC). The 2019

CBC, as amended by the City's Building Code, incorporates the latest seismic design standards for structural loads and materials to provide for the latest in earthquake safety. With adherence to the latest CBC, the latest California seismic design requirements would be included in the proposed project's building design and inspected by the City during construction; therefore, impacts would be less than significant.

a.ii) The entire Southern California region including the project site, is susceptible to strong ground shaking from severe earthquakes. The level of ground shaking that would be experienced at the project site from active or potentially active faults or blind thrust faults in the region would be a function of several factors including earthquake magnitude, type of faulting, rupture propagation path, distance from the epicenter, earthquake depth, duration of shaking, site topography, and site geology. As discussed above, the building design would be reviewed and approved by the City's building inspectors before construction permits are issued to ensure the proposed project is constructed in accordance with the CBC, and thereby the City's Building Code, which includes requirements for structures that reduce the potential for exposure of people or structures to seismic risks to the maximum extent possible. Therefore, a less-than-significant impact associated with strong seismic ground shaking would occur.

a.iii) Liquefaction is a seismic phenomenon in which loose, saturated, granular soils behave similarly to a fluid when subject to high-intensity ground shaking. Specifically, liquefaction occurs when the shock waves from an earthquake of sufficient magnitude and duration compact and decrease the volume of the soil; if drainage cannot occur, this reduction in soil volume will increase the pressure exerted on the water contained in the soil, forcing it upward to the ground surface. This process can transform stable soil material into a fluid-like state. This fluid-like state can result in horizontal and vertical movements of soils and building foundations from lateral spreading of liquefied materials and post-earthquake settlement of liquefied materials. Liquefaction occurs when three general conditions exist: (1) shallow groundwater; (2) low-density non-cohesive (granular) soils; and (3) high-intensity ground motion.

A review of the State of California Seismic Hazard Zone Map for the Torrance Quadrangle (CDMG 1999) indicates that the project site is located in an area designated as having a potential for liquefaction. Furthermore, the City of Carson (City of Carson 2002) indicates the project site is located within an area that has a potential for liquefaction. The Geotechnical Investigation prepared for the proposed project performed a liquefaction analysis. The analysis indicates that the alluvial soils could be susceptible to the liquefaction induced settlements. The foundation design recommendations that would be implemented based on a Final Geotechnical Report would minimize the effects of settlement from liquefaction. In addition, the proposed project would be constructed in accordance with the CBC, and thereby the City's Building Code, which includes requirements for structures that reduce the potential for exposure of people or structures to seismic risks to the maximum extent possible, including liquefaction. As such, the proposed project would not expose additional people or structures to potential substantial

adverse effects associated with liquefaction. Therefore, a less-than-significant impact associated with liquefaction would occur.

a.iv) Due to the relatively flat topography of the project site and surrounding area, the project site would not expose people or structures to potential landslides. Furthermore, the proposed project would be constructed in accordance with the CBC, and thereby the City's Building Code. As such, no impacts would occur regarding the potential for landslides.

b) The project site is currently undeveloped with exposed soil. Under the proposed project, the project site would drain from east to west via gutters that wrap around the proposed buildings. The runoff generated would be treated by a 10-foot by 20-foot Modular Wetland System that would discharge via an 18-inch pipe to the existing 5-foot storm drain inlet and ultimately the Dominguez Channel. During project operation, the project site would be fully developed with buildings and landscaping and would not contain exposed soils. As the proposed project would disturb more than 1 acre of soil, the proposed project would be subject to the requirements of the National Pollution Elimination Discharge System (NPDES), which would require preparation of a Stormwater Pollution Prevention Plan (SWPPP) for approval by the Los Angeles Regional Water Quality Control Board prior to construction. The SWPPP would identify best management practices (BMPs) to be implemented with the proposed project in order to prevent erosion, minimize siltation impacts, and protect water quality. In addition, the proposed project would also be subject to CMC Chapter 8, which contains the City's Stormwater Management and Discharge Control Ordinance. This ordinance is the City's tool to ensure the future health, safety, and general welfare of the citizens of the City and the water quality of the receiving waters of the County of Los Angeles and surrounding coastal areas. Therefore, with implementation of the NPDES and CMC requirements, soil erosion or loss of topsoil impacts would be less than significant.

c) The project site currently contains no existing buildings in a fully urbanized area with relatively flat topography. As discussed previously, the project site is relatively flat and is not located within an area susceptible to landslides.

With regard to liquefaction, while the project site is located within an area that has a potential for liquefaction, the proposed project's building foundation would be designed to minimize the effects of settlement from liquefaction. In addition, the proposed project would be constructed in accordance with the CBC, and thereby the City's Building Code, which includes requirements for structures that reduce the potential for exposure of people or structures to seismic risks to the maximum extent possible, including liquefaction.

With regard to lateral spreading, the Geotechnical Investigation performed an analysis for lateral spreading that indicated that up to 10 inches of lateral displacement toward the Dominguez Channel could occur. As with liquefaction, the grading and foundation design as well as implementation of the City's Building Code, would minimize the effects of lateral spreading.

With regard to subsidence, the project site is not located within an area of known ground subsidence and no large-sale extraction of groundwater, gas, oil, or geothermal energy that would result in subsidence would occur. As such, there is no potential for subsidence on the project site.

Soil collapse is a phenomenon where the soils undergo a significant decrease in volume upon increase in moisture content, with or without an increase in external loads. The Geotechnical Investigation indicates that the upper alluvial soils that underlie the project site are relatively soft and compressible, potentially leading to collapse. As with liquefaction and lateral spreading, the foundation design recommendations as well as implementation of the City's Building Code, would minimize the effects of collapse. As such, conformance with standard engineering practices and design criteria would ensure that the proposed project does not exacerbate existing conditions. Therefore, impacts related to geologic unit or soil that is unstable are less than significant.

d) Expansive soils are typically associated with fine-grained clayey soils that have the potential to shrink and swell with repeated cycles of wetting and drying. Such soils can expose overlying buildings to differential settlement and other structural damage. According to the Geotechnical Investigation, the upper 5 feet of existing soils encountered during the site investigation performed for the Geotechnical Investigation are considered to have a "medium" expansive potential and are classified as "expansive" in accordance with the CBC. The Geotechnical Investigation provides recommendations for the building foundations and slabs that would minimize impacts from expansive soils. Conformance with standard engineering practices and design criteria as recommended in the Final Geotechnical Report, as well as with the CBC, and thereby the City's Building Code, would reduce the potential for substantial risks to life or property as a result of expansive soils to a minimal level and the associated impacts would be less than significant.

e) The project site is located in an urbanized area and is served by community water and sewer service. Furthermore, no septic tanks or alternative wastewater disposal systems are in use or would be required under the proposed project. Therefore, no impact would occur.

f) A review of geologic mapping indicates the entire project lies upon young Quaternary alluvium composed of fine sand and loamy clays. A geotechnical study prepared for the proposed project identified two subsurface sediments within the project site including: (1) artificial fill extending from the surface to 3 to 9 feet deep; and (2) Holocene alluvium consisting of light brown to brown, olive brown, or gray to dark gray interbedded clay, sandy clay, silt, sandy silt, silty sand and clayey underlying the artificial fill to a depth of 51 feet. A database search from the Natural History Museum of Los Angeles County (LACM) identified no fossil localities within the project site or its immediate vicinity.

Project ground disturbing activities would extend to a depth of 6 feet below the ground surface and are unlikely to disturb sediments containing significant paleontological resources. The geologic map and literature review indicates the project site is underlain by artificial fill to a depth of 3–6 feet and Holocene-age alluvial deposits to a depth of 51 feet. These two geologic units have no and low potential to contain intact paleontological resources, respectively. Given the shallow depth of proposed project excavation, coupled

with low paleontological sensitivity of the geologic units within the project site, project implementation is unlikely to impact significant paleontological resources or unique geologic resources. Therefore, no impact would occur and no mitigation measures regarding paleontological resources are needed.

VIII. Greenhouse Gas Emissions

Issues (and Supporting Information Sources)	*Potentially Significant Impact*	*Less than Significant with Mitigation Incorporated*	*Less-than-Significant Impact*	*No Impact*
VIII. GREENHOUSE GAS EMISSIONS—Would the project:				
a) Generate greenhouse gas emissions, either directly or indirectly, that may have a significant impact on the environment?	☐	☐	☒	☐
b) Conflict with an applicable plan, policy, or regulation adopted for the purpose of reducing the emissions of greenhouse gases?	☐	☐	☒	☐

Discussion

a,b) Gases that trap heat in the atmosphere are called greenhouse gases (GHGs). The major concern with GHGs is that increases in their concentrations are causing global climate change. Global climate change is a change in the average weather on Earth that can be measured by wind patterns, storms, precipitation, and temperature. Although there is disagreement as to the rate of global climate change and the extent of the impacts attributable to human activities, most in the scientific community agree that there is a direct link between increased emissions of GHGs and long-term global temperature increases.

The State of California defines GHGs as carbon dioxide (CO_2), methane (CH_4), nitrous oxide (N_2O), sulfur hexafluoride (SF_6), perfluorocarbons (PFCs), and hydrofluorocarbons (HFCs). Because different GHGs have different global warming potentials (GWPs) and CO_2 is the most common reference gas for climate change, GHG emissions are often quantified and reported as CO_2 equivalents (CO_2e). For example, CH_4 has a GWP of 25 (over a 100-year period); therefore, 1 metric ton (MT) of CH_4 is equivalent to 25 MT of CO_2 equivalents ($MTCO_2e$). The State uses the GWP ratios available from the United Nations Intergovernmental Panel on Climate Change (IPCC) and published in the *Fourth Assessment Report* (AR4). By applying the GWP ratios, project-related CO_2e emissions can be tabulated in metric tons (MT) per year. Large emission sources are reported in million metric tons (MMT) of CO_2e.[6]

Some of the potential effects of global warming in California may include loss in snow pack, sea level rise, more extreme heat days per year, more high ozone days, more forest fires, and more drought years (CARB 2008). Globally, climate change has the potential to impact numerous environmental resources through potential, though uncertain, impacts related to future air temperatures and precipitation patterns. The projected effects of global warming on weather and climate are likely to vary regionally, but are expected to include the following direct effects (IPCC 2001):

- Higher maximum temperatures and more hot days over nearly all land areas
- Higher minimum temperatures, fewer cold days and frost days over nearly all land areas
- Reduced diurnal temperature range over most land areas

6 A metric ton is 1,000 kilograms; it is equal to approximately 1.1 U.S. tons and approximately 2,204.6 pounds.

- Increase of heat index over land areas
- More intense precipitation events

Also, there are many secondary effects that are projected to result from global warming, including global rise in sea level, impacts to agriculture, changes in disease vectors, and changes in habitat and biodiversity. While the possible outcomes and the feedback mechanisms involved are not fully understood and much research remains to be done, the potential for substantial environmental, social, and economic consequences over the long term may be great.

California generated 418.2 $MMTCO_2e$ in 2019, the latest year for which data are available from CARB (CARB 2021a). Combustion of fossil fuel in the transportation sector was the single largest source of California's GHG emissions in 2019, accounting for almost 40 percent of total GHG emissions in the State. This sector was followed by the electric power sector (14 percent) and the residential emissions (7 percent) (CARB 2021a).

Impacts of GHGs are borne globally, as opposed to localized air quality effects of criteria air pollutants and toxic air contaminants. The quantity of GHGs that it takes to ultimately result in climate change is not precisely known; however, it is clear that the quantity is enormous, and no single project would measurably contribute to a noticeable incremental change in the global average temperature, or to global, local, or micro climates. From the standpoint of CEQA, GHG impacts to global climate change are inherently cumulative.

The City of Carson has not adopted a threshold of significance for GHG emissions that would be applicable to this project. In December 2008, the SCAQMD adopted a 10,000 $MTCO_2e$ per year significance threshold for industrial facilities for projects in which the SCAQMD is the lead agency. SCAQMD has not formally adopted a significance threshold for GHG emissions generated by a project for which SCAQMD is not the lead agency, nor a uniform methodology for analyzing impacts related to GHG emissions on global climate change. In the absence of any applicable adopted or accepted numerical threshold of significance for GHG emissions, the methodology for evaluating the proposed project's impacts related to GHG emissions focuses on its consistency with State, regional, and local plans adopted for the purpose of reducing and/or mitigating GHG emissions. This evaluation of consistency with such plans is the sole basis for determining the significance of the proposed project's GHG-related impacts on the environment. Notwithstanding, for informational purposes, the analysis also calculates the amount of GHG emissions that would be attributable to the proposed project using recommended air quality models, as described below. The primary purpose of quantifying the proposed project's GHG emissions is to satisfy CEQA Guidelines Section 15064.4(a), which calls for a good-faith effort to describe and calculate emissions. However, the significance of the proposed project's GHG emissions impacts is not based on the amount of GHG emissions resulting from the proposed project. Consistent with SCAQMD guidance, total emissions from construction are amortized over an assumed project lifetime of 30 years and added to operational emissions (SCAQMD 2008).

CEQA Guidelines 15064.4 (b)(1) states that a lead agency may use a model or methodology to quantify GHGs associated with a project. In June 2021, the SCAQMD in conjunction with CAPCOA released the latest version of the CalEEMod (Version 2020.4.0). The purpose of this model is to estimate construction-source and operational-source emissions from direct and indirect sources. Accordingly, the latest version of CalEEMod has been used for this proposed project to estimate the proposed project's emissions. Construction and operations mobile emissions were estimated outside of CalEEMod to account for EMFAC2021 because EMFAC2021 has not yet been incorporated in the current version of CalEEMod (refer to **Appendix G** of this IS/MND for additional details).

Construction Emissions

Construction activities associated with the proposed project would result in emissions of CO_2 and, to a lesser extent, CH_4 and N_2O. Construction-period GHG emissions were quantified based on the same construction schedule and activities as described above in Section III (b). To amortize the emissions over the life of a project, the SCAQMD recommends calculating the total GHG emissions attributable to construction activities, dividing it by a 30-year project life, and then adding that number to a project's annual operational-phase GHG emissions. As such, construction emissions were amortized over a 30-year period and included in the proposed project's annual operational-phase GHG emissions.

Operational Emissions

GHG Emissions

Operational activities associated with the proposed project would result in emissions of CO_2 and, to a lesser extent CH_4 and N_2O. Operational sources of GHG emissions would include mobile sources from vehicles traveling to and from the site, and indirect GHG emissions from export of electricity, water consumption, and waste generation.

A maximum of 580 trips per day are expected (Fehr & Peers 2022). GHG emissions from mobile sources are based on the vehicle emission factors from EMFAC2021 and the default trip length and trip distribution values for the project land uses in CalEEMod, which are Air District-wide average trip distance and trip distribution values. Daily trip generation from the proposed project's LTA, provided in **Appendix L** of this IS/MND, were used to estimate the total VMT for the project trips (Fehr & Peers 2022).

Emissions of GHGs also resulted from the consumption of fossil fuels to generate electricity and to provide heating and hot water to the project site. The project electricity demands are supplied by SCE, which indicates their renewable power accounted for 30.9 percent in 2020.

GHG emissions from solid waste disposal are also calculated using CalEEMod. Emissions are based on solid waste calculated for the proposed project and the GHG emission factors for solid waste decomposition. The GHG emission factors, particularly for CH_4, depend on characteristics of the landfill, such as the presence of a landfill gas capture system and

subsequent flaring or energy recovery. The default values, as provided in CalEEMod, for landfill gas capture (e.g., no capture, flaring, energy recovery) are statewide averages and are used in this assessment.

Emissions Summary

The proposed project's annual GHG emissions are shown in **Table 8**, *Annual Project Greenhouse Gas Emissions*. As shown, the proposed project's total GHG emissions would be 876 $MTCO_2e$. GHG emission calculations are provided in **Appendix G** of this IS/MND.

TABLE 8
ANNUAL PROJECT GREENHOUSE GAS EMISSIONS

Emissions Sources	CO_2e (Metric Tons per Year)[a]
Area	<1
Energy (Electricity, Natural Gas)	77
Mobile	640
EV Charging	1
Waste	62
Water	69
Construction[b]	27
Project Total GHG Emissions	***876***

NOTES:

[a] Totals may not add up exactly due to rounding in the modeling calculations. Refer to **Appendix G** of this IS/MND for details.
[b] Construction emissions are amortized over 30 years.

SOURCE: ESA 2022

The City of Carson General Plan does not identify specific GHG or climate change policies or goals. In the absence of any adopted, quantitative threshold, the proposed project would not have a significant effect on the environment if the proposed project is found to be consistent with the applicable regulatory plans and policies to reduce GHG emissions, including CARB's 2017 Climate Scoping Plan, SCAG's 2020–2045 RTP/SCS, and the City's Energy Efficiency Climate Action Plans (EECAP).

The EECAP, developed by the South Bay Cities Council of Governments, aims to implement energy efficiency and GHG reduction efforts (City of Carson 2015). The proposed project has been evaluated for consistency with the EECAP. According to the EECAP, the City is in the process of implementing strategies to reduce energy consumption across sections, which includes promoting commercial energy retrofits (City of Carson 2015). Consistent with the strategies identified in the EECAP, the proposed project would install lighting and a ventilation system that conforms to the California Green Building Code and include approximately 12,134 square feet of landscaping around the perimeter of the project site. Therefore, the proposed project would be consistent with the applicable GHG reduction strategies in the City's EECAP.

As shown in Table 8 above, the proposed project's highest GHG contributors are from mobile and energy sources. These are highly regulated sources with measures implemented in CARB's 2017 Climate Scoping Plan to reduce GHG emissions from each sector. With respect to relevant statewide GHG reduction strategies, in January 2007, the California Governor enacted Executive Order S-01-07, which mandates the following: (1) establish a statewide goal to reduce the carbon intensity of California's transportation fuels by at least 10 percent by 2020; and (2) adopt a Low Carbon Fuel Standard (LCFS) for transportation fuels in California. CARB identified the LCFS as one of the nine discrete early actions in the Climate Change Scoping Plan. The LCFS regulations were approved by CARB in 2009 and established a reduction in the carbon intensity of transportation fuels by 10 percent by 2020 with implementation beginning on January 1, 2011. In September 2015, CARB approved the re-adoption of the LCFS, which became effective on January 1, 2016, to address procedural deficiencies in the way the original regulation was adopted. In the proposed 2017 Climate Change Scoping Plan Update, CARB's preferred recommendation includes increasing the stringency of the LCFS by reducing the carbon intensity of transportation fuels by 18 percent by 2030, up from the current target of 10 percent by 2020 (CARB 2017). In April 2017, the LCFS was brought before the Court of Appeal challenging the analysis of potential nitrogen dioxide impacts from biodiesel fuels. The Court directed CARB to conduct an analysis of nitrogen dioxide impacts from biodiesel fuels and froze the carbon intensity targets for diesel and biodiesel fuel provisions at 2017 levels until CARB has completed this analysis. On March 6, 2018, CARB issued its Draft Supplemental Disclosure Discussion of Oxides of Nitrogen Potentially Caused by the Low Carbon Fuel Standard Regulation (CARB 2021a). CARB posted modifications to the amendments on August 13, 2018, with a public comment period through August 30, 2018. Final approval of regulatory changes from CARB's analysis of nitrogen dioxide impacts from biodiesel fuels was made on January 4, 2019 (CARB 2021b). The LCFS was amended in September 2018 to require a reduction of at least 7.5 percent in the carbon intensity of California's transportation fuels by 2020 and a 20 percent reduction in carbon intensity from a 2010 baseline by 2030 (CARB 2021c). The 2017 Climate Change Scoping Plan also calls for increasing the mandatory reduction in carbon intensity of transportation fuels from 10 percent to 18 percent by 2030.

As previously stated, the RPS requires publicly owned utilities and retail sellers of electricity in California to procure 33 percent of their electricity sales from eligible renewable sources by 2020 and 50 percent by the end of 2030. SCE, the utility provider for the project site, reported 30.9 percent of their power from renewable sources (SCE 2020). Therefore, GHG emissions from electricity consumption would decrease in future years.

Additionally, SCAG Regional Council adopted the 2020–2045 RTP/SCS on September 3, 2020. The 2020–2045 RTP/SCS includes "more compact, infill, walkable and mixed-use development strategies to accommodate new region's growth would be encouraged to accommodate increases in population, households, employment, and travel demand." Moreover, the 2020–2045 RTP/SCS states the focus would be "growth in existing urban regions and opportunity areas, where transit and infrastructure are already in place. Locating new growth near bikeways, greenways, and transit would increase active

transportation options and the use of other transit modes, thereby reducing number of vehicle trips and trip lengths and associated emissions."

The proposed project would not conflict with the 2020–2045 RTP/SCS goals and benefits intended to improve mobility and access to diverse destinations, provide better "placemaking," provide more transportation choices, and reduce vehicular demand and associated emissions. Therefore, the proposed project would not conflict with the GHG reduction-related actions and strategies contained in the 2020–2045 RTP/SCS.

The project site is located in a neighborhood characterized by a mix of residential and commercial uses. As previously stated, the project site is a proposed self-storage facility with ancillary office and retail uses (likely a mail service store such as a UPS or FedEx). These uses would support measures related to reducing vehicle trips by locating additional retail uses near existing residents and commercial uses.

Overall, the proposed project would not conflict with CARB's implementation of the LCFS or use of renewable energy sources, the City's EECAP, and it would not conflict with SCAG's 2020–2045 RTP/SCS. Therefore, the proposed project would not conflict with an applicable plan, policy, or regulation to reduce GHG emissions. As such, impacts would be less than significant.

IX. Hazards and Hazardous Materials

Issues (and Supporting Information Sources)	*Potentially Significant Impact*	*Less than Significant with Mitigation Incorporated*	*Less-than-Significant Impact*	*No Impact*
IX. HAZARDS AND HAZARDOUS MATERIALS—Would the project:				
a) Create a significant hazard to the public or the environment through the routine transport, use, or disposal of hazardous materials?	☐	☐	☒	☐
b) Create a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials into the environment?	☐	☐	☒	☐
c) Emit hazardous emissions or handle hazardous or acutely hazardous materials, substances, or waste within one-quarter mile of an existing or proposed school?	☐	☐	☐	☒
d) Be located on a site which is included on a list of hazardous materials sites compiled pursuant to Government Code Section 65962.5 and, as a result, would it create a significant hazard to the public or the environment?	☐	☐	☒	☐
e) For a project located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project result in a safety hazard or excessive noise for people residing or working in the project area?	☐	☐	☐	☒
f) Impair implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan?	☐	☐	☒	☐
g) Expose people or structures, either directly or indirectly, to a significant risk of loss, injury, or death involving wildland fires?	☐	☐	☐	☒

This section is based in part on the Phase I Environmental Site Assessment (Phase I ESA), prepared by Weis Environmental, dated January 25, 2021 (refer to **Appendix H** of this IS/MND).

As discussed above, there are known groundwater impacts at the project site. As such, 16 groundwater monitoring wells were installed on the project site and are used as part of the groundwater monitoring program. The Phase I ESA notes that concentrations in existing monitoring wells generally appeared to be stable or decreasing, with a few instances of fluctuation. As it relates to soil impacts, a Soil Excavation Workplan was developed by URS and 7,255.69 tons (approximately 4,837 in-place cubic yards assuming 1.5 tons per cubic yard) of impacted soil were excavated from the project site and disposed off-site. The impacted soil was removed from four distinct areas to depths ranging from approximately 5 to 8 feet. URS concluded that based on confirmation soil sampling for each of the excavations, the cleanup criteria set out in the workplan had been met. URS also stated that a SMP for the project site was prepared to mitigate potential future exposure to residual petroleum hydrocarbons and odor generation during project site development. URS requested that the LARWQCB issue a no further action letter for vadose zone soils at the project site. The LARWQCB reviewed the report and concurred with its findings. A no further action letter for soil was issued by the LARWQCB on December 14, 2015.

With the exception of the known residual petroleum hydrocarbon impacts in soil beneath the project site (below commercial/industrial screening levels) and the known groundwater impacts that have resulted from off-site sources, the Phase I ESA did not identify features and/or conditions indicating the presence or likely presence of hazardous substances and/or petroleum products at the project site.

Discussion

a) Exposure of the public or the environment to hazardous materials can occur through transportation accidents; environmentally unsound disposal methods; improper handling of hazardous materials or hazardous wastes (particularly by untrained personnel) during construction or operation. The severity of these potential effects varies by type of activity, concentration and/or type of hazardous materials or wastes, and proximity to sensitive receptors.

Construction

The project site is located in an urbanized area of the City of Carson, on one parcel, which is currently vacant and undeveloped. Project construction activities would involve minimal use and transport of hazardous materials. Construction would involve the use of some heavy equipment, which use small amounts of oil and fuels. Construction activities that involve hazardous materials are governed by several agencies, including the Environmental Protection Agency (EPA), Caltrans, California Division of Occupational Safety and Health (Cal/OSHA), and the California Department of Toxic Substances Control (DTSC). As required by these regulatory agencies, construction contractors would be required to implement BMPs for handling hazardous materials during construction activities, including following manufacturers' recommendations and regulatory requirements for use, storage, and disposal of chemical products and hazardous materials used in construction; avoiding overtopping construction equipment fuel tanks; routine maintenance of construction equipment; and properly disposing of discarded containers of fuels and other chemicals. Construction contractors are required to implement safety measures in accordance with the General Industry Safety Orders of the California Code of Regulations. Therefore, all construction-related hazardous materials would be transported and disposed of in accordance with applicable codes and regulations. Compliance with applicable federal, State, and local standards is required; therefore, construction-related impacts in regards to the transport, use, or disposal of hazardous materials during construction are less than significant.

Operation

The proposed project would operate as a self-storage facility with ancillary office and retail uses and associated landscaping and facility maintenance. None of the proposed land uses are typically considered a source of hazardous materials. Hazardous materials would be limited to private use of commercially available cleaning products, landscaping chemicals and fertilizers, and various other commercially available substances. In addition, operation of the proposed project would be required to adhere to the environmental covenant recorded against the project site, which requires a vapor barrier to be incorporated in the design of proposed buildings. Furthermore, all future project tenants would be required to

sign a rental agreement that prohibits the storage of hazardous materials and chemicals. Therefore, operational impacts associated with the proposed project related to use, transport, storage, or disposal of hazardous materials would be less than significant.

b) ***Construction***

Construction of the proposed project would require minimal use of hazardous materials typical to construction, including gasoline, motor oils, paints, solvents, and other miscellaneous materials (e.g., engine oil, etc.). All potentially hazardous materials would be used and stored in accordance with manufacturers' instructions and handled in compliance with applicable standards and regulations. The construction phase would involve the use of heavy equipment, which require small amounts of oil and fuels and other potential flammable substances. During construction, equipment would require refueling and minor maintenance on location that could lead to fuel and oil spills. The contractor would be required to identify a staging area for storing materials. Additionally, operators of heavy-duty equipment are required to remain alert, and nearby during fueling of equipment and spills, should they occur, so their spills do not reach the off-site environment. Construction contractors would be required to implement safety measures in accordance with the General Industry Safety Orders of the California Code of Regulations. All construction-related materials would be transported and disposed of in accordance with applicable codes and regulations. Compliance with applicable federal, State, and local standards is required.

As it relates to the petroleum hydrocarbon-impacted soil identified at the project site, impacted soil was removed from the project site and subsequently LARWQCB issued a no further action letter for vadose zone soils at the project site. In addition, as it relates to the petroleum hydrocarbon-impacted groundwater, as noted above, concentrations in existing monitoring wells generally appeared to be stable or decreasing, with a few instances of fluctuation. While the proposed project would excavate the upper 6 feet of existing earth materials, the soils encountered during excavation would be the clean import soils that was backfilled as part of the remediation on the project site. Furthermore, as groundwater was encountered at depths of 12.5 and 17.6 feet beneath the existing ground surface, proposed excavation would not impact the petroleum hydrocarbon-impacted groundwater. Construction would be required to adhere to the SMP and environmental covenant recorded against the site. As such, construction activities would not result in accidental conditions involving existing on-site contamination.

Based on the above, construction-related impacts in regards to significant risk of upset or accidental release of hazardous materials would be less than significant.

Operation

As discussed above, hazardous materials used during operation would be limited to private use of commercially available cleaning products, landscaping chemicals and fertilizers, and various other commercially available substances.

As it relates to the petroleum hydrocarbon-impacted soil identified at the project site, impacted soil was removed from the project site and subsequently LARWQCB issued a no further action letter for vadose zone soils at the project site. In addition, as it relates to the petroleum hydrocarbon-impacted groundwater, as noted above, concentrations in existing monitoring wells generally appeared to be stable or decreasing, with a few instances of fluctuation. Operation of the proposed project would be required to adhere to the environmental covenant recorded against the site, which requires a vapor barrier to be incorporated in the design of future structures. Furthermore, all future storage tenants would be required to sign a rental agreement that prohibits the storage of hazardous materials and chemicals. As such, project operation would not result in upset or accident conditions involving existing on-site contamination. Based on the above, impacts in regards to significant risk of upset or accidental release of hazardous materials during operation of the proposed project would be less than significant.

c) The nearest school to the project site is the Carnegie Middle School, located approximately 0.37 miles southwest. As such, the project site and would not be within 0.25 miles of a school. Therefore, no impacts to existing schools would occur.

d) Based on a review of the databases, as provided in the Phase I ESA, the project site was identified in the RCRA SQG, CLEANUP SITES and DEED State regulatory databases. The project site is referenced with a closed regulatory status as of October 23, 2015, and with a Covenant and Environmental Restriction recorded on the project site. The project site is also listed on the local LA County CUPA and LA HMS regulatory databases. No details are provided in the LA County CUPA database listing. The LA HMA database listing pertains to closed permits pertaining to waste generation and stormwater. In addition, the project site is listed on the non-ASTM FINDS/FRS, HAZNET and HIST MANIFEST regulatory databases. The listings pertain to the manifesting and removal of various wastes. As discussed above, contaminated soils were removed and LARWQCB issued a no further action letter for vadose zone soils at the project site. In addition, as it relates to the petroleum hydrocarbon-impacted groundwater, as noted above, concentrations in existing monitoring wells generally appeared to be stable or decreasing, with a few instances of fluctuation. The site is also subject to a SMP and environmental deed restriction. Furthermore, groundwater monitoring would continue during operation of the proposed project. Therefore, the proposed project would not create a significant hazard to the public or the environment, and impacts would be less than significant.

e) The project site is approximately 3.3 miles from the Compton/Woodley Airport, 4 miles from Long Beach International Airport and Torrance/Zamperini Field.. Based on the Los Angeles County Airport Land Use Plan, the project site is located outside of the Airport Influence Area for the Compton/Woodley Airport and the Long Beach International Airport and Torrance/Zamperini Field (Los Angeles County Airport Land Use Commission 2004). Therefore, the proposed project would not pose any airport safety hazards for people residing or working in the project area, and no impacts would occur.

f) The City has prepared a Multi-Hazard Functional Plan (1996) for emergency response within the City (City of Carson 2004). The plan identifies emergency protocol, critical meeting areas, and emergency evacuation routes. The four major freeways (I-405, State Route [SR]-91, I-110, and I-710) as well as arterial streets with right-of-way widths from 80 to 100 feet at 0.5-mile intervals would serve as potential evacuation routes during a disaster. Potential evacuation routes that occur near the project site include Carson Street, Wilmington Street, Avalon Boulevard, and 223rd Street. While primary access to the project site would be provided from South Perry Street, vehicles travelling to the project site during construction or operation would do so via East Carson Street. During construction, East Carson Street may require temporary partial lane closures. The Applicant would be required to implement a traffic management plan that would ensure that at least one lane remains open and emergency access is maintained during construction. In addition, the vehicle trips generated is not anticipated to impact emergency access provided from East Carson Street and operations are not likely to interfere with an adopted emergency response plan or emergency evacuation plan. Therefore, impacts regarding impairing an emergency response or evacuation plan would be less than significant.

g) The project site is located in an urbanized area and would continue to be served by the Los Angeles County Fire Department (LACFD). According to the California Department of Forestry and Fire Protection (CAL FIRE), the proposed project is not located within a Very High Fire Hazard Severity Zone (CAL FIRE 2022). Construction of the proposed project would be in accordance with the 2019 CBC, 2019 California Fire Code (CFC), which include mandatory measures for fire prevention and emergency access. Therefore, the proposed project would not expose people or structures to a significant risk of loss, injury, or death involving wildland fires, and no impacts would occur.

X. Hydrology and Water Quality

Issues (and Supporting Information Sources)	*Potentially Significant Impact*	*Less than Significant with Mitigation Incorporated*	*Less-than-Significant Impact*	*No Impact*
X. HYDROLOGY AND WATER QUALITY—Would the project:				
a) Violate any water quality standards or waste discharge requirements or otherwise substantially degrade surface or ground water quality?	☐	☐	☒	☐
b) Substantially decrease groundwater supplies or interfere substantially with groundwater recharge such that the project may impede sustainable groundwater management of the basin?	☐	☐	☒	☐
c) Substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river or through the addition of imperious surfaces, in a manner which would:				
i) result in substantial erosion or siltation on- or off-site;	☐	☐	☒	☐
ii) substantially increase the rate or amount of surface runoff in a manner which would result in flooding on- or offsite;	☐	☐	☒	☐
iii) create or contribute runoff water that would exceed the capacity of existing or planned stormwater drainage systems or provide substantial additional sources of polluted runoff; or	☐	☐	☒	☐
iv) impede or redirect flood flows?	☐	☐	☒	☐
d) In flood hazard, tsunami, or seiche zones, risk or release of pollutants due to project inundation?	☐	☐	☐	☒
e) Conflict with or obstruct implementation of a water quality control plan or sustainable groundwater management plan?	☐	☐	☐	☒

This section is based in part on the Carson Self-Storage Preliminary Utilities Technical Memorandum (Utilities Memorandum), prepared by Omega Engineering Consultants, dated March 9, 2022 (refer to **Appendix I** of this IS/MND) and Low Impact Development Plan (LID Plan), also prepared by Omega Engineering Consultants, dated October 5, 2021 (refer to **Appendix J** of this IS/MND).

Discussion

a) The project site is located in an urbanized area of the City of Carson and is currently one vacant undeveloped parcel. As part of Clean Water Act Section 402, the Environmental Protection Agency has established regulations under the NPDES program to control direct stormwater discharges. In California, the State Water Regional Control Board (SWRCB) administers the NPDES permitting program and is responsible for developing NPDES permitting requirements. The NPDES program regulates industrial pollutant discharges, which include construction activities. The SWRCB works in coordination with the nine Regional Water Quality Control Boards (RWQCBs) to preserve, protect, enhance, and restore water quality. The project site is within the jurisdiction of the Los Angeles RWQCB. Impacts related to water quality typically range over three different periods: (1) during the earthwork and construction phase, when the potential for erosion, siltation, and sedimentation would be the greatest; (2) following construction, prior to the establishment of ground cover, when the erosion potential may remain relatively high;

and (3) following completion of a project, when impacts related to sedimentation would decrease markedly, but those associated with urban runoff would increase.

Construction

Project construction could result in short-term impacts to water quality due to the handling, storage, and disposal of construction materials, maintenance and operation of construction equipment, and earthmoving activities. Potential pollutants associated with these activities could damage downstream waterbodies. Dischargers whose projects disturb 1 acre or more of soil or whose projects disturb less than 1 acre but are part of a larger common plan of development that in total disturbs 1 acre or more, are required to obtain coverage under the SWRCB's General Permit for Discharges of Stormwater Associated with Construction Activity Construction General Permit Order 2009- 0009-DWQ (General Construction Permit). The General Construction Permit requires the Applicant to prepare and implement a SWPPP. The SWPPP would specify BMPs to be used during construction of the proposed project to minimize or avoid water pollution, thereby reducing potential short-term impacts to water quality. Upon completion of the proposed project, the Applicant would be required to submit a Notice of Termination to the SWRCB to indicate that construction has been completed. Further, project construction activities would be required to comply with the water quality BMPs set forth in CMC Chapter 8, Storm Water and Urban Runoff Pollution Control. This chapter contains the City's Storm Water Management and Discharge Control Ordinance and includes conditions and requirements established to control urban pollutant runoff into the City's stormwater system. Compliance with the General Construction Permit requirements and CMC Chapter 8, Storm Water and Urban Runoff Pollution Control, would reduce the proposed project's short-term impacts to surface water quality to less-than-significant levels.

As it relates to groundwater quality, as noted above, there are known groundwater impacts at the project site. Concentrations of petroleum hydrocarbon in the groundwater, as monitored in existing monitoring wells on the project site, generally appeared to be stable or decreasing, with a few instances of fluctuation. As groundwater was encountered at depths of 12.5 and 17.6 feet beneath the existing ground surface, the proposed excavation of a maximum of 6 feet would not impact the petroleum hydrocarbon-impacted groundwater. Therefore, the proposed project's short-term impacts to groundwater quality would be less than significant.

Operation

The primary constituents of concern during the operational phase of the proposed project would be solids, oils, and greases from parking areas, driveways, and truck loading bays that could be carried off-site. Project design features would address the anticipated and expected pollutants of concern during the proposed project's operational phase. On-site landscaping, which would comprise approximately 10.2 percent of the total project site after construction of the proposed project, would assist in minimizing the amount of runoff from the project site by providing permeable areas for water infiltration and decreasing runoff volume. Infiltration through landscaped areas would also serve as a water treatment function.

Requirements for waste discharges potentially affecting stormwater from project operations are set forth in CMC Chapter 8, Storm Water and Urban Runoff Pollution Control. Standard Urban Stormwater Mitigation Plan (SUSMP) requirements include minimizing stormwater pollutants and limiting peak post-project stormwater runoff rates to no greater than predevelopment rates where increased runoff could increase downstream erosion.

As described in the LID Plan, as provided in **Appendix J** of this IS/MND, the project site is relatively level with drainage consisting of surface flow. The project site drains towards the west to an existing 5-foot storm drain inlet that outlets directly to the Dominguez Channel. Under the proposed project, the project site would drain from east to west via gutters that wrap around the proposed buildings. The runoff generated would be treated by a 10-foot by 20-foot Modular Wetland System that would discharge via an 18-inch pipe to the existing 5-foot storm drain inlet, as under existing conditions. As such, surface water quality would not be degraded.

As noted above in Section IX, *Hazards and Hazardous Materials*, there are known groundwater impacts at the project site. There are 16 groundwater monitoring wells present at the project site that are used as part of the groundwater monitoring program. Primary groundwater contaminants of concern identified in these wells included total petroleum hydrocarbons in the gasoline range, benzene and diisopropyl ether. It was noted that concentrations in existing monitoring wells generally appeared to be stable or decreasing, with a few instances of fluctuation. Groundwater monitoring would continue during operation of the proposed project.

In general, projects control pollutants, pollutant loads, and runoff volume from the project site by minimizing the impervious surface area and controlling runoff through infiltration, bioretention, or rainfall harvest and use. Additionally, projects are required to incorporate BMPs as outlined in the SWPPP and in accordance with the requirements of the municipal NPDES permit. Compliance with these water quality and water discharge standards would ensure that the proposed project would not degrade surface or ground water quality, and impacts would be less than significant.

b) The project site is located in an urbanized area of the City of Carson and is currently one vacant undeveloped parcel. The project site consists of mostly pervious surfaces. As described in the Utilities Memorandum, as provided in **Appendix I** of this IS/MND, the project site is approximately 3.5 percent impervious. With development of the proposed project, as analyzed in the Utilities Memorandum, the project site would be 89.8 percent impervious. However, while under the proposed condition impervious surfaces would increase, the project site is not located near groundwater recharge wells and no groundwater recharge facilities exist downstream of the project site.

In addition, no new sources of water supply, such as groundwater, are required to meet the proposed project's water demand. Potable water would be supplied by the California Water Service (Cal Water) Dominguez District. Based on the 2020 Urban Water Management

Plan (UWMP), the Cal Water Dominguez District receives its water from 17 percent groundwater, 15 percent recycled water, and 68 percent purchased water (California Water Service 2020). The proposed project uses would not result in a substantial increase in demand as the self-storage units would not generate a demand for water and the proposed office and retail uses would generate minimal water use. Therefore, implementation of the proposed project would not significantly affect groundwater supplies. Furthermore, as noted above, the project site is not located near groundwater recharge wells and no groundwater recharge facilities exist downstream of the project site. Therefore, the proposed project would not substantially deplete groundwater supplies or interfere with groundwater recharge that may impede sustainable groundwater management of the basin and, thus, impacts would be less than significant.

c.i) While no streams, rivers, or natural drainages occur on the project site, the Dominguez Channel is located to the west of the project site; a flood control easement separates the Dominguez Channel from the project site. The project site is located in an urban area and is currently one vacant undeveloped parcel. Existing surface runoff from the project site is currently directed to an existing 5-foot storm drain inlet that outlets directly to the Dominguez Channel. Under the proposed project, the project site would drain from east to west via gutters that wrap around the proposed buildings. The runoff generated would be treated by a 10-foot by 20-foot Modular Wetland System that would discharge via an 18-inch pipe to the existing 5-foot storm drain inlet, as under existing conditions. As described above, impervious surfaces would increase from approximately 3.5 percent impervious to 89.8 percent impervious in the proposed condition. As discussed above, during construction, the proposed project would be required to comply with BMP's identified in the RWQCB issued SWPPP, which would reduce the potential for erosion or siltation to occur. During project operation, the project site would be fully developed with buildings and landscaping and would not contain exposed soils. Therefore, compliance with BMPs would ensure that the proposed project would not substantially alter the drainage pattern of the project site in a manner that would result in the substantial erosion or siltation on- or off-site and impacts would be less than significant.

c.ii) While no streams, rivers, or natural drainages occur on the project site, the Dominguez Channel is located to the west of the project site. The project site is located in an urban area and is currently one vacant undeveloped parcel. As described above, surface runoff is currently directed to an existing 5-foot storm drain inlet that outlets directly to the Dominguez Channel. Under the proposed project, the project site would drain from east to west via gutters that wrap around the proposed buildings. The runoff generated would be treated by a 10 foot by 20-foot Modular Wetland System that would discharge via an 18-inch pipe to the existing 5-foot storm drain inlet, as under existing conditions. As described above, impervious surfaces would increase from approximately 3.5 percent impervious to 89.8 percent impervious in the proposed condition. As further analyzed in the drainage report, under the proposed project, peak flowrates would increase from 3.12 cubic feet per second (cfs) to 6.74 cfs. As detailed in the Utilities Memorandum, all proposed on-site conveyances for the proposed project were designed to safely convey the

flowrates generated by a 100-year storm and flooding on-site is not anticipated. Therefore, a less-than-significant impact resulting from flooding would occur.

c.iii) The project site is located in an urban area and is currently one vacant undeveloped parcel. As described above, surface runoff is currently directed to an existing 5-foot storm drain inlet that outlets directly to the Dominguez Channel. Under the proposed project, the project site would drain from east to west via gutters that wrap around the proposed buildings. The runoff generated would be treated by a 10 foot by 20-foot Modular Wetland System that would discharge via an 18-inch pipe to the existing 5-foot storm drain inlet, as under existing conditions. As discussed above, the Applicant would be required to comply with the standard BMPs in the SWPPP, as identified by the RWQCB. Therefore, the proposed project would not provide substantial additional sources of polluted runoff, and potential impacts to surface water quality would be less than significant. Furthermore, the existing drainage pattern would remain largely the same under the proposed project, and thus, the proposed project would be adequately served by the existing 5-foot storm drain inlet during project operations. Therefore, the proposed project would not exceed the capacity of existing or planned storm drain systems and impacts would be less than significant.

c.iv) The project site is not within 100-year flood hazard area as indicated by the Federal Emergency Management Agency (FEMA 2020). In addition, the proposed project would adhere to all standards and requirements identified in the CMC Chapter 8 and project specific SWPPP, which would require implementation of measures that reduce the potential for flooding on- or off-site. Thus, adherence with these measures would ensure that impacts are less than significant.

d) As discussed above, the project site is not within 100-year flood hazard area as indicated by the Federal Emergency Management Agency (FEMA 2020). In addition, the proposed project would adhere to all standards and requirements identified in the CMC Chapter 8 and project specific SWPPP, which would require implementation of measures that reduce the potential for flood hazards.

Due to the distance of the City to the Pacific Ocean, located approximately 5.58 miles west of the City, the potential for tsunami effects within the City is negligible. Furthermore, the absence of any large bodies of water within Carson preclude the possibility of damage from seiche effects on the project site (City of Carson 2004). Given the lack of flood hazard, tsunami, or seiche risk in the project area, there would be no impacts anticipated.

e) There are no applicable water quality control plan or sustainable groundwater management plans for the project site. As stated above, the project site is located in an urbanized area and is currently one vacant undeveloped parcel. The project site has been previously developed and does not serve as a source of groundwater. Therefore, the proposed project would not conflict with or obstruct the implementation of a water quality control plan or sustainable groundwater management plan and there would be no impacts anticipated.

XI. Land Use and Planning

Issues (and Supporting Information Sources)	*Potentially Significant Impact*	*Less than Significant with Mitigation Incorporated*	*Less-than-Significant Impact*	*No Impact*
XI. LAND USE AND PLANNING—Would the project:				
a) Physically divide an established community?	☐	☐	☐	☒
b) Cause a significant environmental impact due to a conflict with any land use plan, policy, or regulation adopted for the purpose of avoiding or mitigating an environmental effect?	☐	☐	☒	☐

Discussion

a) The project site is located in an urbanized area of the City of Carson and is currently vacant and undeveloped. Development of the proposed project would not physically divide an established community as the proposed project would develop one vacant parcel surrounded by urbanized uses with uses similar to those in the surrounding area. Thus, the proposed project would not divide an established community and no impacts would occur.

b) According to the City of Carson General Plan, the project site has a General Plan land use designation of Light Industrial and a zoning code designation of Manufacturing Light – with Site Plan and Design Review Overlay (ML-D). The proposed project would require a general plan amendment (from Light Industrial to Heavy Industrial), zone change, adoption of a specific plan for specific uses and deviations from the development standards that may not apply, and a development agreement.

Table 9, *General Plan Consistency Analysis*, analyzes the proposed project's consistency with relevant General Plan Land Use Element goals and policies. As demonstrated in Table 9, the proposed project is consistent with the General Plan Land Use Element.

The City uses the specific plan process to establish type, location, and character of development to take place on a property (City of Carson 2002). Although a specific plan allows flexibility of development in regard to land use and design concepts, the overall design guidelines are required to follow City standards. The proposed project would be designed to be compatible with zoning and design regulations as detailed in the specific plan and would adhere to allowable building height and setbacks.

Based on the analysis above and upon approval of the requested entitlements, the proposed project would not conflict with applicable goals and policies in the General Plan or applicable regulations under the Zoning Code. Therefore, the proposed project would result in less-than-significant impacts.

TABLE 9
GENERAL PLAN CONSISTENCY ANALYSIS

Relevant Policies	Project Consistency Analysis
Goal LU-2: Rehabilitation and/or removal of abandoned buildings and facilities.	As discussed in the Phase I ESA, the project site formerly was improved with commercial/industrial uses. These uses were demolished between 2009 and 2012. There are no habitable structures present on the project site, however, remnant improvements are still present on the project site. Under the proposed project, the remnant structures would be removed, and a self-storage facility would be developed. The redevelopment of the project site would not conflict with this goal.
Goal LU-6: A sustainable balance of residential and non-residential development and a balance of traffic circulation throughout the City.	The proposed project would be developed on a site that was previously developed with commercial/industrial uses. The proposed uses include a self-storage facility which would be in keeping with the previous uses on the project site as well as the surrounding existing commercial uses along East Carson Street. As such, development of the proposed project would not conflict with this goal.
Policy LU-12.3: Review landscape plans for new development to ensure that landscaping relates well to the proposed land use, the scale of structures, and the surrounding area. Policy LU-12.5: Improve City appearance requiring landscaping to screen, buffer, and unify new and existing development. Mandate continued upkeep of landscaped areas.	As described in Chapter 2, Project Description, the proposed project would include approximately 12,134 square feet of landscaping around the perimeter of the project site. A variety of drought tolerant ornamental shrubs and medium size trees, which would be varying in height, would be included as a part of the proposed landscaping. In addition, a landscape screen would be installed on the northern boundary of the project site, which would serve to screen the self-storage facility from the residential uses directly to the north of the project site. These landscape features would not conflict with these policies.
Policy LU-13.4: Encourage architectural variation of building and parking setbacks along the streetscape to create visual interest, avoid monotony and enhance the identity of individual areas. Encourage pedestrian orientation by appropriate placement of buildings.	As described further in Chapter 2, Project Description, the proposed project would consist of neutral-toned building materials in Spanish styled architecture, which include Spanish accents, Spanish tile roof, spandrel glazing, and landscaping. The proposed design would largely resemble a multi-family residential building in its aesthetics and massing. This design would provide for architectural variation along Carson Street, creating visual interest and avoiding monotony and would not conflict with this policy.
Policy LU-15.1: Encourage the location of housing, jobs, shopping, services, and other activities within easy walking distance of each other.	The proposed project includes cafe/retail uses totaling 4,675 square feet in proximity to residential uses and the nearby Perry Street Mini-Park. The location of the cafe/retail uses would serve to encourage residents to the north and southeast of the project site to walk to the project site. As such, the proposed project would not conflict with this policy.
Policy LU-15.7: Provide for efficient use of water through the use of drainage, drought tolerant landscaping, and use of reclaimed water, efficient appliances, and water conserving plumbing fixtures.	As described above, a variety of drought tolerant ornamental shrubs and medium size trees, which would be varying in height, would be included as a part of the proposed landscaping. The use of drought tolerant landscaping would provide for efficient use of water and would not conflict with this policy.

XII. Mineral Resources

Issues (and Supporting Information Sources)	*Potentially Significant Impact*	*Less than Significant with Mitigation Incorporated*	*Less-than-Significant Impact*	*No Impact*
XII. MINERAL RESOURCES—Would the project:				
a) Result in the loss of availability of a known mineral resource that would be of value to the region and the residents of the State?	☐	☐	☐	☒
b) Result in the loss of availability of a locally-important mineral resource recovery site delineated on a local general plan, specific plan, or other land use plan?	☐	☐	☐	☒

Discussion

a) The project site is located in the City of Carson in an urbanized area, on one vacant parcel with surrounding residential and commercial uses. According to the Los Angeles County Conservation and Natural Resources Element and the California Department of Conservation (CDC), the project site is not in Mineral Resource Zone 2 (MRZ-2), as identified in Figure 9.6, Mineral Resources (County of Los Angeles 2015), and the CDC Mineral Lands Classification Map (CDC 2022). MRZ-2 zones are characterized as areas that are underlain by significant measured or indicated mineral resources. Additionally, according to the City's General Plan Safety Element, the City does not contain any known mineral resources (City of Carson 2004). No mineral extraction or other mining operations have historically or currently occur within the project site, nor would the proposed project result in the loss of availability of any known mineral resource. Therefore, no impact to a known mineral resource would occur.

b) No mineral extraction or other mining operations have historically or currently occurred within the project site, nor would the proposed project result in the loss of availability of any locally important mineral resource. In addition, the project site is not identified as an area that contains known mineral resources in the City's General Plan (City of Carson 2004). Therefore, no impacts would occur to a locally important mineral resources.

XIII. Noise

Issues (and Supporting Information Sources)	*Potentially Significant Impact*	*Less than Significant with Mitigation Incorporated*	*Less-than-Significant Impact*	*No Impact*
XIII. NOISE—Would the project result in:				
a) Generation of a substantial temporary or permanent increase in ambient noise levels in the vicinity of the project in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies?	☐	☒	☐	☐
b) Generation of excessive groundborne vibration or groundborne noise levels?	☐	☐	☒	☐
c) For a project located within the vicinity of a private airstrip or an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project expose people residing or working in the project area to excessive noise levels?	☐	☐	☒	☐

Discussion

a) Noise is defined as unwanted sound; however, not all unwanted sound rises to the level of a potentially significant noise impact. To differentiate unwanted sound from potentially significant noise impacts, the City of Carson has established noise regulations that take into account noise-sensitive land uses. The following analysis evaluates potential noise impacts at nearby noise-sensitive land uses that may result from construction and operation of the proposed project.

Noise Principles and Descriptors

Sound can be described as the mechanical energy of a vibrating object transmitted by pressure waves through a liquid or gaseous medium (e.g., air). Noise is generally defined as unwanted sound (i.e., loud, unexpected, or annoying sound). Acoustics is defined as the physics of sound. In acoustics, the fundamental scientific model consists of a sound (or noise) source, a receiver, and the propagation path between the two. The loudness of the noise source and obstructions or atmospheric factors affecting the propagation path to the receiver determines the sound level and characteristics of the noise perceived by the receiver. Acoustics addresses primarily the propagation and control of sound (Caltrans 2013a, Section 2.2.1).

Sound, traveling in the form of waves from a source, exerts a sound pressure level (referred to as sound level) that is measured in decibels (dB), which is the standard unit of sound amplitude measurement. The dB scale is a logarithmic scale (i.e., not linear) that describes the physical intensity of the pressure vibrations that make up any sound, with 0 dB corresponding roughly to the threshold of human hearing and 120 to 140 dB corresponding to the threshold of feeling and pain, respectively. In a non-controlled environment, a change in sound level of 3 dB is considered "just perceptible," a change in sound level of 5 dB is considered "clearly noticeable," and a change in 10 dB is perceived as a doubling of sound volume (Caltrans 2013a, Section 2.1.3). Pressure waves traveling through air exert a force registered by the human ear as sound (Caltrans 2013a, Section 2.1.3).

The typical human ear is not equally sensitive to all frequencies of the audible sound spectrum. As a consequence, when assessing potential noise impacts, sound is measured using an electronic filter that deemphasizes the frequencies below 1,000 hertz (Hz) and above 5,000 Hz in a manner corresponding to the human ear's decreased sensitivity to extremely low and extremely high frequencies. This method of frequency weighting is referred to as A-weighting and is expressed in units of A-weighted decibels (dBA). A-weighting follows an international standard methodology of frequency de-emphasis and is typically applied to community noise measurements (Caltrans 2013a, Section 2.1.3).

An individual's noise exposure is a measure of noise over a period of time, whereas a noise level is a measure of noise at a given instant in time. Community noise varies continuously over a period of time with respect to the contributing sound sources of the community noise environment. Community noise is primarily the product of many distant noise sources, which constitute a relatively stable background noise exposure, with the individual contributors unidentifiable. The background noise level changes throughout a typical day, but does so gradually, corresponding with the addition and subtraction of distant noise sources such as traffic. What makes community noise variable throughout a day, besides the slowly changing background noise, is the addition of short-duration, single-event noise sources (e.g., aircraft flyovers, motor vehicles, sirens), which are readily identifiable to the individual. These successive additions of sound to the community noise environment change the community noise level from instant to instant, requiring the measurement of noise exposure over a period of time to legitimately characterize a community noise environment and evaluate cumulative noise impacts (Caltrans 2013a, Section 2.2.2.1).

The time-varying characteristic of environmental noise over specified periods of time is described using statistical noise descriptors in terms of a single numerical value, expressed as dBA. The most frequently used noise descriptors are summarized below (Caltrans 2013a, Section 2.2.2.2):

L_{eq}: The L_{eq}, or equivalent continuous sound level, is used to describe the noise level over a specified period of time, typically 1-hour, i.e., $L_{eq(1)}$, expressed as L_{eq}. The L_{eq} may also be referred to as the "average" sound level.

L_{max}: The maximum, instantaneous noise level.

L_{min}: The minimum, instantaneous noise level.

L_X: The noise level exceeded for specified percentage (x) over a specified time period; i.e., L_{50} and L_{90} represent the noise levels that are exceeded 50 and 90 percent of the time specified, respectively.

L_{dn}: The L_{dn} is the average noise level over a 24-hour day, including an addition of 10 dBA to the measured hourly noise levels between the hours of 10 p.m. to 7 a.m. to account for nighttime noise sensitivity. L_{dn} is also termed the day-night average noise level or DNL.

CNEL: Community Noise Equivalent Level (CNEL), is the average noise level over a 24-hour day that includes an addition of 5 dBA to the measured hourly noise levels

between the evening hours of 7 p.m. to 10 p.m. and an addition of 10 dBA to the measured hourly noise levels between the nighttime hours of 10 p.m. to 7 a.m. to account for noise sensitivity during the evening and nighttime hours, respectively. CNEL and L_{dn} noise levels typically differ by less than 1 dBA and are generally interchangeable.

City of Carson Municipal Code

CMC Article 5, Chapter 5, details the City's approach to noise control and standards. CMC Section 5500 states the City's intent to adopt the Los Angeles County Municipal Code (LACMC) Noise Control Ordinance (Title 12, Chapter 12.08) as the CMC's own noise control ordinance with some key amendments. LACMC Section 12.08.390(B) sets standards for acceptable exterior noise levels. The standards are intended to protect the community from excessive noise levels that have the potential to: (i) interfere with sleep, communication, relaxation, and enjoyment of property; (ii) contribute to hearing impairment; and (iii) adversely affect the value of property. The standards for exterior noise levels are summarized in **Table 10**, *City of Carson Exterior Noise Level Standards*. Noise measurement calculations are provided in **Appendix K** of this IS/MND.

TABLE 10
CITY OF CARSON EXTERIOR NOISE LEVEL STANDARDS

Zone	Time Interval	Hourly Equivalent Sound Level (dBA, L_{eq})
I. Noise Sensitive Area	Anytime	45 dBA
II. Residential Properties (nighttime)	10 p.m. to 7 a.m.	45 dBA
Residential Properties (daytime)	7 a.m. to 10 p.m.	50 dBA
III. Commercial Properties (nighttime)	10 p.m. to 7 a.m.	55 dBA
Commercial Properties (daytime)	7 a.m. to 10 p.m.	60 dBA
IV. Industrial Properties	Anytime	70 dBA

SOURCE: LACMC Section 12.08.390.

CMC Article 5, Chapter 5, Section 5502, provides a list of amendments added to the LACMC for application in the City of Carson. Section 5502 amends CMC Chapter 12.08, Part 4, to address noise standards for construction activities with nearby residential land uses. Long-term construction (defined as more than 21 days of scheduled work) is permitted Monday through Saturday from 7 a.m. to 8 p.m. given construction does not exceed 65 dBA in single-family residential areas, 70 dBA in multi-family residential areas, and 70 dBA in semi-residential/commercial areas. Construction noise levels take precedence over the noise standards listed in Table 10, above. Section 5502(h) lists amendments to the LACMC for procedures for obtaining a variance from the requirements of CMC Article 5, Chapter 5, which may be granted by the Planning Commission for a period not to exceed 2 years, subject to such terms, conditions and requirements as may be reasonable under the circumstances.

City of Carson General Plan Noise Element

In addition to the previously described CMC provisions, the City has also established noise guidelines in the Noise Element of the City's General Plan that are used for planning purposes (City of Carson 2002). These guidelines are based in part on the community noise compatibility guidelines established by the California State Governor's Office of Planning and Research and are intended for use in assessing the compatibility of various land use types with a range of noise levels (Office of Planning and Research 2017). **Table 11**, *City of Carson Guidelines for Noise Compatible Land Use*, provides the guidelines of land use compatibility for community noise sources. The CNEL noise levels for specific land uses are classified into four categories: (1) "normally acceptable"; (2) "conditionally acceptable"; (3) "normally unacceptable"; and (4) "clearly unacceptable." A CNEL value of 65 dBA is considered the dividing line between a "conditionally acceptable" and "normally unacceptable" noise environment for noise sensitive land uses, including residences, and schools. A CNEL value of 70 dBA is considered the dividing line between a "normally acceptable" and "normally unacceptable" noise environment for noise sensitive land uses, including neighborhood parks.

Thresholds of Significance

The City of Carson's noise ordinances regulate construction and operational noise. With respect to the community noise assessment, changes in noise levels of less than 3 dBA are generally not discernable to most people, while changes greater than 5 dBA are readily noticeable and would be considered a significant increase. Therefore, the significance threshold for mobile source noise is based on human perceptibility to changes in noise levels (increases) with consideration of existing ambient noise conditions and City's land use noise compatibility guidelines. Therefore, the proposed project would result in a significant noise impact if:

- For sensitive receptors located in the City of Carson, project construction activities would generate noise levels in one of the following two conditions: (a) in single-family residential areas that exceed a maximum of 65 dBA for single-family residential uses or a maximum of 70 dBA for multi-family residential, semi-residential, or commercial uses between the hours of 7 a.m. and 8 p.m., Monday through Saturday; or (b) in residential areas that exceed the ambient noise-based threshold (ambient noise + 5 dBA) between the hours of 7 a.m. and 8 p.m., Monday through Saturday.
- Project on-site stationary sources (i.e., air conditioning units, pumps) increase existing ambient noise levels at adjacent sensitive receptors by 5 dBA or more if the existing noise levels do not already exceed the City's exterior noise standards, or by 3 dBA or more if the existing noise levels already exceed the City's exterior noise standards or if the resulting noise levels would result in the exceedance of the City's exterior noise standards.
- Project-related off-site traffic increases ambient noise levels by 5 dBA CNEL or more along roadway segments with sensitive receptors, and the resulting noise level occurs on a noise-sensitive land use within an area categorized as "normally acceptable;" or causes ambient noise levels to increase by 3 dBA CNEL or more and the resulting noise occurs on a noise-sensitive land use within an area categorized as "conditionally acceptable," "normally unacceptable," or "clearly unacceptable."

TABLE 11
CITY OF CARSON GUIDELINES FOR NOISE COMPATIBLE LAND USE

Land Use Categories	Community Noise Exposure (CNEL, dB)			
	Normally Acceptable	Conditionally Acceptable	Normally Unacceptable	Clearly Unacceptable
Residential – Low Density	50–60	60–65	65–75	75–85
Residential Multi-Family	50–60	60–65	65–75	75–85
Transient Lodging, Hotel, Motel	50–65	65–70	70–80	80–85
School, Library, Church, Hospital, Nursing Home	50–60	60–65	65–80	80–85
Auditorium, Concert Hall, Amphitheater	N/A	50–65	N/A	65–85
Sports Arena, Outdoor Spectator Sports	N/A	50–70	N/A	70–85
Playground, Neighborhood Park	50–70	N/A	70–75	75–85
Golf Course, Riding Stable, Water Recreation, Cemetery	50–70	N/A	70–80	80–85
Office Building, Business, Commercial, Professional	50–67.5	67.5–75	75–85	N/A
Agriculture, Industrial, Manufacturing, Utilities	50–70	70–75	75–85	N/A

NOTES:

Based on the Governor's Office of Planning and Research, "General Plan Guidelines" 1990. To help guide determination of appropriate land use and mitigation measures vis-a-vis existing or anticipated ambient noise levels.

A = Normally Acceptable: Specified land use is satisfactory, based upon the assumption buildings involved are conventional construction, without any special noise insulation.

C = Conditionally Acceptable: New construction or development only after a detailed analysis of noise mitigation is made and needed noise insulation features are included in project design. Conventional construction, but with closed windows and fresh air supply systems or air conditioning will suffice.

N = Normally Unacceptable: New construction or development generally should be discouraged. A detailed analysis of the noise reduction requirements must be made and noise insulation features included in the design of a project.

U = Clearly Unacceptable: New construction or development should generally not be undertaken.

SOURCE: City of Carson 2002

Noise Sensitive Receptors

The project area is located at 21611 South Perry Street on the north side of East Carson Street east of I-405 and Dominguez Channel. The following land uses are located in proximity to the project area:

- **West** – Land use immediately west of the project area is the Dominguez Channel. Further west of the project area there is the I-405.
- **North** – Land uses north of the project area consists of single-family residential uses approximately 50 feet from the project site.
- **East** – Land uses to the east of the project area consists of non-noise-sensitive commercial uses and noise-sensitive residential uses.
- **South** – Land uses to the south of the project site across East Carson Street consists of non-noise-sensitive commercial uses.

Existing Conditions

The proposed project is located in an area surrounded by a mixture of land uses including residential and commercial uses. The project site is located north of East Carson Street,

east of I-405 and the Dominguez Channel, west of South Perry Street, and south/southwest of Perry Street Mini-Park and single-family residential neighborhoods. An auto repair facility and a truck dealer are located to the east and south across South Perry and East Carson Streets. The City of Carson's General Plan designates the project site as Light Industrial.

To quantify the existing noise environment of the project site, four short-term (15-minute) noise measurements were conducted at locations R1 through R4, located around the project site to the north, northwest, east, and southeast along South Perry Street and East Carson Street. Ambient sound measurements were conducted on Thursday, October 21, 2021, to characterize the existing noise environment in the project vicinity.

The ambient noise measurement was conducted in accordance with the City's standards. The ambient noise measurement was conducted using a Larson-Davis Model LxT Sound Level Meter (SLM). The Larson-Davis LxT SLM is a Type 1 standard instrument, as defined in the American National Standard Institute (ANSI) S1.4. The SLM was calibrated and operated according to manufacturer specifications. The SLM microphone was placed at a height of 5 feet above ground level.

This monitoring location provides a representative characterization of the existing noise conditions within the vicinity of the project site. The results of the ambient noise measurement data are summarized in **Table 12**, *Summary of Ambient Noise Measurements*. As shown in Table 12, the measured L_{eq} ranges from 56.5 to 72.0 dBA. Vehicular traffic is the dominant source for noise in the project area.

TABLE 12
SUMMARY OF AMBIENT NOISE MEASUREMENTS

Site ID	Monitoring Date(s)	Start Time	End Time	L_{eq}	L_{max}	L_{min}
R1 north of project site along residential property line	10/21/2021	8:55 a.m.	9:10 a.m.	58.6	63.1	53.8
R2 at northeast corner of South Perry Street and East 216th Street	10/21/2021	9:17 a.m.	9:32 a.m.	56.5	68.7	50.6
R3 east of project site along South Perry Street	10/21/2021	9:33 a.m.	9:48 a.m.	57.1	70.2	52.3
R4 southeast of project site along and south of East Carson Street	10/21/2021	10:02 a.m.	10:17 a.m.	72.0	82.9	54.0

SOURCE: ESA 2022

Construction Noise

Project construction is expected to commence in first quarter of 2023 and would last through third quarter of 2024. The proposed project consists of (1) site preparation, (2) grading/excavation, (3) drainage/utilities/trenching, (4) foundations/concrete pour, (5) building construction, (6) paving, (7) architectural coating, and (8) landscaping.

On-Site Construction Activities

Noise from construction activities would be generated by the operation of vehicles and equipment involved during various stages of construction: site preparation, building construction, etc. The noise levels generated by construction equipment would vary depending on factors such as the type and number of equipment, the specific model (horsepower rating), the construction activities being performed, and the maintenance condition of the equipment. To more accurately characterize construction-period noise levels, the average (Hourly L_{eq}) noise level associated with each construction phase is estimated based on the quantity, type, and usage factors for each type of equipment used during each construction phase and are typically attributable to multiple pieces of equipment operating simultaneously. Over the course of a construction day, the highest noise levels would be generated when multiple pieces of construction equipment are operated concurrently.

Consistent with LACMC Section 12.08.440 (which was adopted by reference by the City of Carson), the construction noise levels were estimated at the property line of the closest sensitive receptor location. As previously stated, the project site is surrounded by a mix of land uses, including residential and commercial uses. The closest sensitive receptors to the project site are the single-family residences to the north located approximately 50 feet from the project site. It is conservatively assumed that multiple equipment would operate simultaneously. In reality, equipment would likely be dispersed throughout the project site; therefore, the noise levels represent a conservative maximum and actual noise levels could be lower. Further, the closest sensitive receptors in each affected area were analyzed and it is assumed that sensitive receptors located at further distances would experience lower noise levels than those disclosed below. Generally, noise attenuates at a rate of 6 dBA for every doubling of distance from the noise source.[7] **Table 13**, *Construction Equipment and Estimated Noise Levels*, presents the list of construction equipment including approximate quantities per construction phase with reference noise levels.

The estimated noise levels, shown in Table 13**,** assumes the project contractor(s) would equip the construction equipment, stationary or mobile, with properly operating and maintained noise mufflers, consistent with the manufacturers' standard operation procedures. These assumptions represent a worst-case noise scenario as all construction equipment used in a given phase would not typically operate concurrently and at full power, and the location of activities is routinely spread across the construction site, rather than concentrated close to the nearest noise-sensitive receptors.

7 Noise from a localized source (i.e., point source) propagates uniformly outward in a spherical pattern, referred to as "spherical spreading." Stationary point sources of noise, including stationary mobile sources such as idling vehicles, attenuate (i.e., reduce) at a rate between 6 dBA for acoustically "hard" sites for each doubling of distance from the reference measurement, Caltrans, Technical Noise Supplement, September, 2013.

NOTE:

Noise Levels at 50 feet and Usage Factor are derived from Federal Highway Administration's Roadway Construction Noise Model User's Guide. Usage factors are the ratio of the time that a piece of equipment is in use to the total time that it could be in use. Usage factors are typically attributable to multiple pieces of equipment operating simultaneously.

SOURCE: ESA 2022

As shown in Table 13**,** estimated construction noise levels at the off-site receptors in the vicinity of the project site range from 59 to 81.8 dBA L_{eq}. CMC Section 12.08, Part 4, limits construction noise levels to 65 dBA L_{eq} for semi-residential receptors between the hours of 7 a.m. and 8 p.m. The project construction noise levels per phase would exceed 65 dBA L_{eq} at the nearest sensitive source and impacts would be significant without mitigation. Because it would take a buffer zone of 400 feet from the residences to reduce the construction noise level to 65 dBA Leq (maximum combined construction noise levels range from 82 and 81 dBA Leq, respectively from R1 and R3), it is not feasible or practical to implement a buffer zone for on-site construction activity.

As stated earlier, CMC Article 5, Chapter 5, Section 5502, provides a list of amendments added to the LACMC for application in the City of Carson. Section 5502(c) amends CMC Chapter 12.08, Part 4, to address noise standards for construction activities with nearby residential land uses. Long-term construction (defined as more than 21 days of scheduled work) is permitted Monday through Saturday from 7 a.m. to 8 p.m. given construction does not exceed 65 dBA in single-family residential areas, 70 dBA in multi-family residential areas, and 70 dBA in semi-residential/commercial areas. Construction noise levels take precedence over the noise standards listed in Table 10, above.

In order to meet the criteria of the ambient noise-based threshold (ambient noise + 5 dBA) between the hours of 7 a.m. and 8 p.m., Monday through Saturday, temporary construction noise barriers would be implemented for residences to the north and east of the project site, as described in Mitigation Measure MM-NOI-1. In addition, as stated previously, it is conservatively assumed that multiple equipment would operate simultaneously near the project boundary. In reality, equipment would likely be dispersed throughout the project site; as such, the noisiest equipment, such as paving equipment or concrete saws, would be restricted to have no more than two pieces of the heavy-duty equipment use at the same time within a 50-foot distance of the project site boundary, as described in Mitigation Measure MM-NOI-2. **Table 14**, *Construction Noise Levels with Mitigation,* shows the reduced construction noise levels at the off-site sensitive receivers. Noise levels attributable to on-site construction activity would be reduced, with attenuation provided by the temporary construction noise barriers and the added distance from the sensitive receptors, to comply with the threshold of ambient noise levels plus 5 dBA. With the implementation of Mitigation Measures MM-NOI-1 and MM-NOI-2, Project construction noise would also comply with the City's 65 dBA Leq noise threshold for single-family residences.

TABLE 14
CONSTRUCTION NOISE LEVELS WITH MITIGATION

Sensitive Receptor Location	Estimated Construction Noise (Leq, dBA)	Construction Noise Levels with Mitigation (Leq, dBA)	Construction Noise Threshold (Ambient + 5 dBA)	Significant?
R1	81.8	62.8	63.6	No
R2	79.0	60.5	61.5	No
R3	80.9	58.5	62.1	No
R4	74.2	73.3	77.0	No

SOURCE: ESA 2022

The proposed project would comply with LACMC Section 12.08.440 and CMC Section 7-12.22; the proposed project's construction activities, including delivery and haul routes, would be prohibited between the hours of 7 p.m. and 7 a.m. Monday through Saturday or any time on Sundays or holidays.

Therefore, with respect to a violation of the noise standards and regulations established in the CMC, noise impacts during project construction would be less than significant with implementation of Mitigation Measures MM-NOI-1 and MM-NOI-2.

Off-Site Construction Activities

During all phases of construction, haul and vendor truck trips would be required to bring construction materials and building debris to and from the project site. The temporary addition of the number of trips required per day during construction activities would not result in a doubling of trips along access roads leading to the project site. Therefore, the increase in noise level would be substantially less than the threshold of a 5 dBA increase in an area characterized by normally acceptable and conditionally acceptable noise levels or a 3 dBA increase in an area characterized by conditionally unacceptable or normally unacceptable noise levels. In order to increase traffic noise levels by 3 dBA, the traffic volumes with the proposed project would need to double from the "Existing" to the "with Project" conditions. The proposed project would not cause traffic volumes to double as a result of implementation and operation. Additionally, the off-site haul truck activities are temporary in nature and would only take place for 13 months after which the proposed project would cease to have any significant lasting noise impact on the surrounding areas. Therefore, off-site construction traffic noise impacts would be less than significant and no mitigation measures would be required.

Operational Noise

The existing noise environment in the project vicinity is dominated by traffic noise from nearby roadways, as well as nearby commercial activities. Long-term operation of the proposed project would have a minimal effect on the noise environment in proximity to the project area. Noise generated by the proposed project would result primarily from the added off-site traffic.

Off-Site Traffic Noise

Vehicle trips attributed to operation of the proposed project would increase average daily traffic (ADT) volumes along the major thoroughfares within the project vicinity, which was analyzed to determine if any traffic-related noise impacts would result from project development. Typically, a doubling of traffic volumes increases the hourly equivalent sound level by approximately 3 dBA (FHWA 2018). The proposed project would not double existing daily trips along access roads leading to the project site and traffic noise from the proposed project would generate less than a 3 dBA increase. Therefore, operation of the proposed project would not result in a substantial increase in project-related traffic noise levels over existing traffic noise levels in the project vicinity. The increase in noise level would be substantially less than threshold of a 5 dBA increase in an area characterized by normally acceptable and conditionally acceptable noise levels or 3 dBA increase in an area characterized by conditionally unacceptable or normally unacceptable noise levels. In order to increase traffic noise levels by 3 dBA, the traffic volumes with the proposed project would need to double from the "Existing" to the "With Project" conditions. The proposed project would not cause traffic volumes to double as a result of implementation and operation. As a result, project-related operational traffic noise impacts would be less than significant.

To predict the noise increase due to vehicular traffic, the Federal Highway Administration's Traffic Noise Model (TNM), Version 2.5, was used to predict vehicular traffic noise levels at off-site noise-sensitive receivers based on peak hour trip rates and trip distribution from the traffic study. The estimated noise contribution from project trips was then compared to existing noise levels. The project noise contribution, existing noise levels, and estimated combined noise levels are shown in **Table 15**, *Predicted Existing Traffic Noise Levels*.

As shown in Table 15, the predicted project-related traffic noise level increase over existing baseline noise levels along the analyzed roadways by up to 0.6 dBA. A change of less than 1 dBA in sound levels generally cannot be perceived by the human ear and an increase of 3 dBA would be barely perceivable (Caltrans 2013b). As the increase in traffic noise levels generated by the proposed project would not exceed the 3 dBA thresholds barely perceivable by the human ear, the proposed project's traffic noise impact would be less than significant.

Table 16, *Predicted Future Traffic Noise Levels*, lists the future traffic noise levels and future with project traffic noise levels. As shown in Table 16, the predicted project-related traffic noise level increase over future baseline noise levels along the analyzed roadways by up to 0.5 dBA. A change of less than 1 dBA in sound levels generally cannot be perceived by the human ear and an increase of 3 dBA would be barely perceivable (Caltrans 2013b). As the increase in traffic noise levels generated by the proposed project would not exceed the 3 dBA thresholds barely perceivable by the human ear, the proposed project's future traffic noise impact would be less than significant.

On-Site Operational Noise

Project operations include five or six employees on-site throughout the course of the week. There would be two storage managers in the first few months of opening, two employees in the cafe and one or two employees in the mail room. However, none of these employees would be living on–site. Therefore, no noise-sensitive area would be located on the project site. Storage managers and on-site employees in the cafe and the mail room would not generate any substantial noise and there would not be any noise impacts on noise sensitive land uses in proximity of the project site.

Mechanical Equipment

The operation of mechanical equipment that would be installed for the new facility, such as air conditioners, fans, generators, and related equipment, would generate audible noise levels in proximity to the equipment. Mechanical equipment would typically be located on rooftops or within buildings, shielded from nearby land uses by parapet or building walls to attenuate noise and avoid conflicts with noise sensitive land uses in proximity of the project site. All building outdoor mounted mechanical and electrical equipment would be designed to meet the requirements of Municipal Code Section 12.08.390. A conservative exterior noise level reference for air condenser units, the primary source of noise from fixed mechanical equipment, is 81.9 dBA L_{eq} measured at a distance of 5 feet based on a review of noise data from several large shopping center projects in Southern California (Moreno Valley 2015; Pomona 2014).

The analysis conservatively assumes mechanical equipment would be mounted on the building rooftop at the closest edge to the sensitive receptors to the north and east. The sensitive receptors would be approximately 200 feet from the mechanical equipment (or

160 feet from the project site's property line) and the noise level would attenuate by 32 dBA from distance divergence to 49.9 dBA L_{eq}. Since the ambient noise levels in the project vicinity near this sensitive receiver (refer to ambient noise measurement R1) already exceeded the City of Carson's noise standards for stationary operational noise sources, the determination of noise impact is then to compare project-related noise levels to the prevailing ambient noise levels at the sensitive receiver site. The projected noise level of 49.9 dBA Leq would not exceed the significant threshold of 62.1 dBA or 63.6 dBA (ambient noise plus 5 dBA) Leq at the sensitive receptors to the east and north, respectively. Therefore, environmental impacts related to the exposure of persons to or generation of noise levels in excess of established standards during long-term operation of the proposed project would be less than significant.

Loading Activity and Refuse Collection

The proposed project would have on-site refuse collection areas located at the back of the building near the western project site and would be accessed from East Carson Street to the south of the project site boundary.

Refuse collection vehicles would travel on East Carson Street for refuse pickup; however, refuse pickup generally lasts for several minutes similar to refuse pickup services for all other uses in the area, which would generate an incidental amount of noise and would not significantly contribute to permanent noise increases in the area.

Loading activities, such as truck movements/idling and loading/unloading operations, would generate noise levels of approximately 70 dBA Leq at a reference distance of 50 feet from the noisiest portion of the truck (i.e., to the side behind the cab and in line with the engine and exhaust stacks), based on a noise survey that was conducted by ESA at a loading dock facility, which shows that loading dock activity (namely idling semi-trucks and backup alarm beeps) would generate such noise levels. Delivery truck idling is restricted to no more than 5 consecutive minutes in the loading area pursuant to State regulation (Title 13 California Code of Regulations, Section 2485). Pursuant to Title 13 California Code of Regulations, Section 2485, signs would be posted in delivery loading areas specifying this idling restriction. Loading area noise levels at the noise sensitive receptors are summarized in **Table 17**, *Estimated Loading Area Noise Levels (L_{EQ})*. As shown, the proposed project's loading area noise contribution would not increase the ambient noise by more than 5 dBA; therefore, impacts would be less than significant.

TABLE 17
ESTIMATED LOADING AREA NOISE LEVELS (L_{EQ})

Receptor Location	Distance to Receptor Property Line (feet)	Existing Ambient Noise Levels, dBA (L_{eq})[a]	Estimated Loading Area Noise Levels, dBA (L_{eq})	Ambient + Project Noise Levels, dBA (L_{eq})	Significance Threshold, dBA (L_{eq})	Exceed Significance Threshold
Residential uses to the north	160	58.6	59.9	62.3	63.6	No

NOTE:

[a] Existing ambient noise measurement was taken along the project site's northern boundary along the residential property line and is representative of the noise environment in the surrounding area. Noise measurement data is provided as part of **Appendix K** of this IS/MND.

SOURCE: ESA 2022

Composite Noise Impacts from Project Operations

An evaluation of the combined noise from the proposed project's various operational noise sources (i.e., composite noise level) was conducted to conservatively ascertain the potential maximum project-related noise level increase that may occur at the noise-sensitive receptor locations included in this analysis. Noise sources associated with the proposed project would include on-site mechanical equipment, loading/refuse area, and parking area.

Composite noise levels at the noise sensitive receptors are summarized in **Table 18**, *Estimated Composite Noise Levels from Project Operations*. As shown, the proposed project's composite noise contribution would not increase the ambient noise by more than 5 dBA; therefore, impacts would be less than significant.

TABLE 18
ESTIMATED COMPOSITE NOISE LEVELS FROM PROJECT OPERATIONS

Mitigation Measure

MM-NOI-1. Temporary construction noise barriers, with a minimum rating of Sound Transmission Class (STC) 30 and Noise Reduction Coefficient (NRC) 0.7, shall be

implemented prior to grading/site preparation beginning on–site near the northern and northeastern project boundaries (R1, R2, and R3) as follows:

- Along the northern project boundary: A noise barrier with a minimum height of 15 feet above grade.
- Beginning at the northeast corner of the subject site and continuing south along the eastern project boundary to 15 feet beyond the southern edge of the multi-family complex located at 21610 S. Perry Street: A noise barrier with a minimum height of 18 feet above grade.

MM-NOI-2. No more than two pieces of the following specific off-road construction equipment shall be used at the same time within 50 feet the north and north-eastern boundary of the project site. Such equipment includes the following:

- Concrete Saws
- Pavers
- Paving Equipment
- Generators
- Pumps

These pieces of equipment have the highest reference noise level as indicated by the Federal Highway Administration's Roadway Construction Noise Model User's Guide. By limiting the number of noisy equipment operating at the same time within 50 feet of the north and north-eastern boundary of the project site, the cumulative noise effect from multiple equipment will be reduced.

b) The project improvements would be constructed using typical construction techniques. As such, it is anticipated that the equipment to be used during construction would not expose persons to or generate excessive groundborne vibration. Post-construction on-site activities would be limited to commercial uses that would not generate excessive groundborne vibration.

Vibration Principles and Descriptors

Groundborne vibration from development is primarily generated from the operation of construction equipment and from vehicle traffic. Groundborne vibration propagates from the source through the ground to adjacent buildings by surface waves. Vibration energy dissipates as it travels through the ground, causing the vibration amplitude to decrease with distance away from the source. Vibration in buildings is typically perceived as rattling of windows, shaking of loose items, or the motion of building surfaces. The vibration of building surfaces also can be radiated as sound and heard as a low-frequency rumbling noise, known as groundborne noise. Vibration levels for potential structural damage is described in terms of the peak particle velocity (PPV) measured in inches per second (in/sec).

Groundborne vibration is generally limited to areas within a few hundred feet of certain types of industrial operation and construction activities such as pile driving. Road vehicles

rarely create enough groundborne vibration amplitude to be perceptible to humans unless the receiver is in immediate proximity to the source or the road surface is poorly maintained and has potholes or bumps. If traffic, typically heavy trucks, does induce perceptible building vibration, it is most likely an effect of low-frequency airborne noise or ground characteristics.

Building structural components also can be excited by high levels of low-frequency airborne noise (typically less than 100 Hz). The many structural components of a building, excited by low-frequency noise, can be coupled together to create complex vibrating systems. The low-frequency vibration of the structural components can cause smaller items such as ornaments, pictures, and shelves to rattle, which can cause annoyance to building occupants.

Human sensitivity to vibration varies by frequency and by receiver. Generally, people are more sensitive to low-frequency vibration. Human annoyance also is related to the number and duration of events; the more events or the greater the duration, the more annoying it becomes. Groundborne vibration related to human annoyance is generally related to root mean square (rms) velocity levels, and expressed as velocity in decibels (VdB).

Regulatory Framework

The City of Carson does not address vibration either in its respective municipal codes or in the Noise Element of the General Plans. With respect to groundborne vibration from construction activities, Caltrans has adopted guidelines/recommendations to limit groundborne vibration based on the age and/or condition of the structures that are located in close proximity to construction activity. With respect to residential and commercial structures, Caltrans' technical publication, titled Transportation- and Construction-Induced Vibration Guidance Manual, provides a vibration damage potential threshold criteria of 0.5 inches per second PPV for historic and older buildings, 1.0 inch-per-second PPV for newer residential structures, and 2.0 inches per second PPV for modern industrial/commercial buildings. In addition, the guidance also sets 0.035 PPV as the threshold for "distinctly perceptible" human response to steady state vibration (Caltrans 2013b).

According to the Federal Transit Administration, ground vibrations from construction activities very rarely reach the level that can damage structures. A possible exception is the case of old, fragile buildings of historical significance where special care must be taken to avoid damage. The construction activities that typically generate the most severe vibrations are blasting and impact pile driving, which would not be used for the proposed project. The proposed project would use construction equipment such as skid steer loaders and excavators, which would generate groundborne vibration during excavation and foundation activities. Based on the vibration data by the Federal Transit Administration, typical vibration velocities from the operation of a large bulldozer would be approximately 0.089 inches per second PPV at 25 feet from the source of activity, 0.031 inches per second PPV at 50 feet distance, and 0.011 inches per second PPV at 100 feet distance.

Construction Vibration

The nearest off-site single-family residential buildings are located to the north of the project site, which are approximately 50 feet from the project site. At a distance of 50 feet, the maximum vibration level (using large bulldozer as an example, as shown above) would be reduced from the level measured at 25 feet and would be well below the Caltrans construction vibration structure damage criteria as the proposed project would not generate vibration levels at nearby buildings that would exceed the 0.5 inches per second PPV structural damage threshold or the 0.035 inches per second PPV "distinctly perceptible" human response threshold. Therefore, construction vibration impacts would be less than significant and mitigation measures are not required.

Operational Vibration

Once construction activities have been completed, there would be no substantial sources of vibration activities from the project area. The proposed project's operations would include industrial-grade stationary mechanical and electrical equipment, such as pumps, compressor units, and exhaust fans, which would produce limited levels of vibration.

Groundborne vibration generated by each of the above-mentioned equipment and activities would generate approximately up to 0.0014 inches per second PPV at locations adjacent (within 50 feet) to the project site (ASHRAE 1999). The potential vibration levels from all project operational sources at the closest existing building and human annoyance receptor locations would be less than the significance criteria for building damage and human annoyance of 0.5 inches per second PPV and 0.035 inches per second PPV, respectively as the closest sensitive receptors are approximately 50 feet away from the project site. As such, vibration impacts associated with operation of the proposed project would be less than significant, and no mitigation measures are required.

c) The project area is located approximately 3.3 miles from the Compton/Woodley Airport, 4 miles from Long Beach International Airport and Torrance/Zamperini Field. However, the project site is located outside of these airports' 65 dBA CNEL noise contour and outside of the airport influence area. Therefore, construction or operation of the proposed project would not expose people to excessive airport related noise levels and impacts would be less than significant.

XIV. Population and Housing

Issues (and Supporting Information Sources)	*Potentially Significant Impact*	*Less than Significant with Mitigation Incorporated*	*Less-than-Significant Impact*	*No Impact*
XIV. POPULATION AND HOUSING—Would the project:				
a) Induce substantial unplanned population growth in an area, either directly (for example, by proposing new homes and businesses) or indirectly (for example, through extension of roads or other infrastructure)?	☐	☐	☒	☐
b) Displace substantial numbers of existing people or housing, necessitating the construction of replacement housing elsewhere?	☐	☐	☐	☒

Discussion

a) A project could induce population growth in an area directly or indirectly. For example, direct population growth can occur by introducing new businesses or residential areas and indirect growth by extending roads or other infrastructure. The project site is located in an urbanized area and is currently vacant and undeveloped. The proposed project would develop a self-storage facility with ancillary office and retail uses. Given these uses, which are not residential in nature, the proposed project would not induce direct population growth.

Employment opportunities during operation of the proposed project are not anticipated to substantially increase the population or housing in the area, since the employees would likely already live in or near the existing urbanized project area or consist of regional commuters. The proposed project would not contribute to employment growth in the City of Carson forecasted by the 2020–2045 RTP/SCS (SCAG 2020). Based on SCAG's forecast, the anticipated 5 to 6 employees that would be generated under the proposed project would account for 0.009 percent of the employee forecast for 2024, which is the proposed project's expected year of operation. Further, indirect growth from extension of roads and infrastructure would not be anticipated, as the proposed project would not add any new roadways, and would be served by existing infrastructure with minor proposed upgrades and connections to accommodate the proposed project. Therefore, the proposed project would not introduce unplanned infrastructure that was not previously evaluated in the adopted General Plan. The proposed project would introduce a self-storage facility that would serve the area population; however, the provision of storage services is not anticipated to induce population growth as these services are already widely available and the availability of these services does not determine housing growth. Therefore, the proposed project would not result in a substantial population increase during operation, and impacts would be less than significant.

b) The project site is located in an urbanized area of the City of Carson and is currently vacant and undeveloped. No residential uses are located on the project site. Therefore, no impacts related to the displacement of substantial quantity of existing residences would occur.

XV. Public Services

Issues (and Supporting Information Sources)	*Potentially Significant Impact*	*Less than Significant with Mitigation Incorporated*	*Less-than-Significant Impact*	*No Impact*
XV. PUBLIC SERVICES—Would the project:				
a) Result in substantial adverse physical impacts associated with the provision of new or physically altered governmental facilities, need for new or physically altered government facilities, the construction of which could cause significant environmental impacts, in order to maintain acceptable service ratios, response times, or other performance objectives for any of the following public services:				
i) Fire protection?	☐	☐	☒	☐
ii) Police protection?	☐	☐	☒	☐
iii) Schools?	☐	☐	☐	☒
iv) Parks?	☐	☐	☐	☒
v) Other public facilities?	☐	☐	☐	☒

Discussion

a.i) LACFD serves the City of Carson and responds from six fire stations located within the City. The closest station to the project site is LACFD Station 127, approximately 1.6 miles southwest from the project site at 127 West 223rd Street. In conformance with the California Constitution Article XIII, Section 35(a)(2) and *City of Hayward v. Trustee of California State University*, 242 Cal. App. 4th 833 (2015), the City has and will continue to meet its legal obligations to provide adequate public safety services, including fire protection and emergency medical services, and the need for additional fire protection and emergency medical services is not an environmental impact that CEQA requires a project proponent to mitigate.

Construction

Construction of the proposed project could increase the potential for on-site fires from such sources as the operation of mechanical equipment, the use of flammable construction materials, or the careless disposal of cigarettes. However, implementation of "good housekeeping" procedures by the construction contractors and the work crews would minimize fire hazards associated with the construction of the proposed project. Such measures would be in effect during construction of the proposed project.

Construction activities could also have the potential to affect fire protection services, such as emergency vehicle response times, by adding construction traffic to the street network and by partial lane closures during street improvements, utility installations, and construction staging. However, these impacts would be less than significant, as the Applicant would be required to implement a traffic management plan that would ensure that at least one lane remains open and emergency access is maintained during construction. In addition, any lane closures that would occur would require review and approval by the LACFD. Implementation of a traffic management plan would minimize

the effects of construction on vehicular traffic, including emergency vehicles, and assist in the orderly flow of vehicular circulation in the area of the proposed project.

In summary, project construction would be temporary in nature and, thus, would not require additional fire protection and emergency services to the extent that there would be a need for new or expanded fire facilities in order to maintain acceptable service ratios, response times, or other performance objectives of the LACFD. Therefore, construction-related impacts to fire protection services would be less than significant.

Operation

The proposed project would develop a currently vacant site with a self-storage facility and ancillary office and retail uses. The proposed project would be served by the LACFD Station 36, approximately 1.46 miles southwest from the project site at 127 West 223rd Street. While the proposed project would introduce new uses to a currently vacant site, the proposed buildings would include installation of an automatic fire sprinkler system. Specifically, fire suppression within the proposed buildings would consist of an NFPA-13 sprinkler system. In addition, construction type is to be Type-II non-combustible. Furthermore, as required by the California Health and Safety Code, the proposed project would be required to comply with all requirements pertaining to fire protection systems, such as the adequate provisions of smoke alarms, fire extinguishers, building access, emergency response notification systems, and fire flows. With adherence to California Health and Safety Code, LACFD standards and regulations, the proposed project would install adequate fire protection systems and, thus, would not result in the need for new or physically altered governmental facilities, the construction of which could cause a significant environmental impact. Furthermore, a regional fire Hydrant Flow Test was performed by Cal Water for the existing hydrant on the west side of Perry Street, within the immediate vicinity of the project site, which confirms the available pressure and capacity of the existing fire hydrant is sufficient (refer to **Appendix I** of this IS/MND). Therefore, impacts to fire protection services would be less than significant.

a.ii) The project site is in the City of Carson, which is under the Los Angeles County Sheriff (LASD)'s Carson Station jurisdiction. The project site is within the Carson Station's service area and is approximately located 0.56 miles north of the project site at 21356 S. Avalon Boulevard. In conformance with the California Constitution Article XIII, Section 35(a)(2) and the *City of Hayward v. Trustee of California State University* ruling, the City has and will continue to meet its legal obligations to provide adequate public safety services, including police protection, and the need for additional police protection is not an environmental impact that CEQA requires a project proponent to mitigate.

The self-storage facility would feature a contemporary 24-hour security system including keypad entry security gates, individually monitored and alarmed storage units, video surveillance monitoring, burglar alarms, as well as an intercom system. The on-site manger and/or other office personnel would monitor these security systems on a control panel during hours of operation. Should there be a violation of any of the security systems when the management office is closed, an independent security firm will respond. Thus,

implementation of the proposed project would not significantly increase demand for police protection services provided by the LASD. In addition, the proposed project would be subject to site plan review by the City prior to project approval to ensure that it meets City requirements in regard to safety (e.g., nighttime security lighting); thus, discouraging criminal activity and reducing demand for police protection services. As such, the proposed project would not require LASD to expand or construct new stations to serve the project site and impacts would be less than significant.

a.iii) The proposed project does not include a residential component, which would create housing or any other facility that would increase the local population that would require an increase of student at local schools. Therefore, no impact would occur.

a.iv) The City of Carson contains approximately 599 acres of open space and parkland. This includes Neighborhood and Community Parks, Golf Courses, a Blimp Port, as well as drainage courses and utility transmission corridors (City of Carson 2004). Further, 243 acres of recreational open space is provided by both California State University Dominguez Hills and public schools located in the City (City of Carson 2004). The City's standard for permanent public open space is 4 acres per 1,000 residents. The closest park to the project site is Perry Street Mini-Park, located approximately 32 feet northeast of the project site at the corner of 215th Place and South Perry Street. Project visitors are not anticipated to make use of the Perry Street Mini-Park to an extent that would affect its performance. The proposed project would develop commercial uses and would result in a minimal increase in employees at the project site. The proposed project would not introduce inhabitants to the project area that would require the use of parks or recreational facilities in the vicinity of the project site. Therefore, no impact would occur.

a.v) The proposed project would not introduce inhabitants to the project area that would require the use of library facilities in the vicinity of the project site. Therefore, no impact would occur.

XVI. Recreation

Issues (and Supporting Information Sources)	*Potentially Significant Impact*	*Less than Significant with Mitigation Incorporated*	*Less-than-Significant Impact*	*No Impact*
XVI. RECREATION				
a) Would the project increase the use of existing neighborhood and regional parks or other recreational facilities such that substantial physical deterioration of the facility would occur or be accelerated?	☐	☐	☐	☒
b) Does the project include recreational facilities or require the construction or expansion of recreational facilities which might have an adverse physical effect on the environment?	☐	☐	☐	☒

Discussion

a) As the proposed project does not include residential uses, the proposed project would not result in increased use of recreational facilities. Project visitors are not anticipated to make use of the Perry Street Mini-Park to an extent that would cause or accelerate its substantial physical deterioration. Therefore, no impacts to neighborhood and regional parks or other recreational facilities would occur.

b) The proposed project would not include the construction or expansion of recreational facilities. In addition, the proposed project does not include residential uses which would require the construction or expansion of recreation facilities. Therefore, no impacts related to the adverse physical effect on the environment due to the construction or expansion of recreation facilities would occur.

XVII. Transportation

Issues (and Supporting Information Sources)	*Potentially Significant Impact*	*Less than Significant with Mitigation Incorporated*	*Less-than-Significant Impact*	*No Impact*
XVII. TRANSPORTATION—Would the project:				
a) Conflict with a program plan, ordinance or policy addressing the circulation system, including transit, roadway, bicycle and pedestrian facilities?	☐	☐	☒	☐
b) Would the project conflict or be inconsistent with CEQA Guidelines Section 15064.3, subdivision (b)?	☐	☐	☒	☐
c) Substantially increase hazards due to a geometric design feature (e.g., sharp curves or dangerous intersections) or incompatible uses (e.g., farm equipment)?	☐	☐	☒	☐
d) Result in inadequate emergency access?	☐	☐	☒	☐

Background

This impact analysis presented in this section is informed, in part, by the 21611 South Perry Street Local Transportation Assessment (LTA) for the proposed project prepared by Fehr & Peers on January 18, 2022, which is included as **Appendix L** of this IS/MND. The LTA addresses the proposed project's operational impacts on traffic operations at nearby intersections as well as site access (i.e., driveway queuing, parking supply/demand). Parking is not an environmental impact requiring evaluation under CEQA, and therefore is not discussed in the analysis below.

Discussion

a) The project site is one vacant parcel that consists of approximately 2.8 acres located to the east of the I-405 interchange with East Carson Street. The project site is bounded by a single-family residential neighborhood to the north, a mix of residential and commercial uses to the east, a truck dealership to the south, and the Dominguez Channel to the west. Access to the project site would be provided by a new driveway on South Perry Street between East 216th Street and East Carson Street.

The project site is located adjacent to a variety of existing transportation facilities. I-405 provides the primary regional access to the project site; major arterials that would be used for local access to the project site include East Carson Street in the east/west direction and Avalon Boulevard and Wilmington Avenue in the north/south direction. With respect to roadways, the Transportation and Infrastructure Element of the City of Carson General Plan mainly considers roadway classifications as defined in the Carson Master Plan of Streets (e.g., local streets, collector streets), designated truck facilities, and traffic operations standards based on the concept of level of service (LOS). The proposed project does not propose to change any roadway classifications or established truck routes. Furthermore, the LOS measure used to govern roadway operations in the General Plan is no longer used in CEQA to determine the significance of a transportation impact. CEQA Guidelines Section 15064.3(b), which was adopted in December 2018 by the California Natural Resources Agency, require lead agencies to evaluate transportation impacts based

on VMT. Project consistency with CEQA Guidelines Section 15074.3(b) is discussed below under Issue b).

The project site is served by one public transit route, Long Beach Transit Route 4, which provides connections to the Los Angeles Metropolitan Transportation Authority (Metro) J Line bus rapid transit at Carson Station and the Metro A Line light rail at Del Amo Station. There are limited bicycle facilities located near the project site; East Carson Street is designated as a Class III bike route west of I-405. Roadways adjacent to the project site generally have of 4- to 8-foot-wide sidewalks, but there are no marked crosswalks or pedestrian signals. As detailed in the City of Carson Master Plan of Bikeways and Metro's Active Transportation Strategic Plan, there are several bike lanes and bike routes planned near the project site as well as a planned extension of the bike path along both sides of the Dominguez Channel, east of I-405. There is an existing flood control easement that separates the Dominguez Channel from the project site where the bike path could be located. Implementation of the proposed project would not remove or impede access to existing bicycle facilities, sidewalks, or transit services adjacent to the project site, nor would it affect future planned bicycle facility improvements along other nearby roadways or the Dominguez Channel.

Therefore, based on the above, impacts to program plans, ordinances, or policies addressing the circulation system would be less than significant.

b) The Technical Advisory on Evaluating Transportation Impacts in CEQA (Office of Planning and Research 2018) was used to conduct the VMT analysis pursuant to CEQA Guidelines Section 15064.3, Subdivision (b). Based on the proposed project characteristics, it can be classified as local-serving retail. As described in the Technical Advisory, local-serving retail can be screened from a quantitative VMT analysis for CEQA purposes:

> *"By adding retail opportunities into the urban fabric and thereby improving retail destination proximity, local-serving retail development tends to shorten trips and reduce VMT."*

Based on the above, the proposed project would not conflict with CEQA Guidelines Section 15064.3, Subdivision (b), and the impact would be less than significant.

c) An impact would occur if the proposed project substantially increased hazards due to a design feature. A review of existing site conditions and nearby roadways determined that there are no existing hazardous design features, such as sharp curves, non-standard driveways, or dangerous intersections, on–site or within the vicinity of the project site. The site was previously developed with commercial/industrial uses, and the proposed project would not introduce any such design hazards or include any uses that are incompatible with normal traffic operations. The proposed project would provide direct access to and from South Perry Street from a new driveway between East 216th Street and East Carson Street. The project driveway approach would be stop-controlled (i.e., not signalized). The LTA prepared for the proposed project (refer to **Appendix L** of this IS/MND) evaluated

operating conditions for the proposed project driveway, and concluded that no potential safety issues would result from queueing at the driveway.

Impacts related to traffic hazards or incompatible uses would be expected to be similar and as such, would be less than significant.

d) A significant impact would occur if the design of the proposed project would not satisfy local emergency access requirements. As analyzed in Section IX, *Hazards and Hazardous Materials*, above, while primary access to the project site would be provided from South Perry Street, vehicles travelling to the project site during construction or operation would do so via East Carson Street, a City designated evacuation route as identified in the Multi-Hazard Functional Plan for emergency response within the City (City of Carson 2004). During construction, East Carson Street may require temporary partial lane closures. As part of the project entitlement process, the Applicant would be required to implement a traffic management plan, which would ensure that at least one lane remains open and emergency access is maintained during construction. In addition, based on the operational analysis conducted in the LTA (refer to **Appendix L** of this IS/MND), additional traffic generated by the proposed project is not anticipated to result in a noticeable increase in roadway congestion that would affect emergency access provided from East Carson Street, and operations are not likely to interfere with an adopted emergency response plan or emergency evacuation plan. Therefore, impacts related to emergency access would be less than significant.

XVIII. Tribal Cultural Resources

Issues (and Supporting Information Sources)	*Potentially Significant Impact*	*Less than Significant with Mitigation Incorporated*	*Less-than-Significant Impact*	*No Impact*
XVIII. TRIBAL CULTURAL RESOURCES—Would the project:				
a) Cause a substantial adverse change in the significance of a tribal cultural resource, defined in Public Resources Code Section 21074 as either a site, feature, place, cultural landscape that is geographically defined in terms of the size and scope of the landscape, sacred place, or object with cultural value to a California Native American tribe, and that is:				
i) Listed or eligible for listing in the California Register of Historical Resources, or in a local register of historical resources as defined in Public Resources Code Section 5020.1(k), or	☐	☒	☐	☐
ii) A resource determined by the lead agency, in its discretion and supported by substantial evidence, to be significant pursuant to criteria set forth in subdivision c) of Public Resources Code Section 5024.1. In applying the criteria set forth in subdivision c) of Public Resources Code Section 5024.1, the lead agency shall consider the significance of the resource to a California Native American tribe.	☐	☒	☐	☐

Discussion

The following discussion is based on the 21611 Perry Street Self-Storage Project, Cultural Resources Assessment Report, located in **Appendix C** of this IS/MND, as well as consultation conducted between tribes requesting consultation and the City, as provided in **Appendix M** of this IS/MND. **Appendix C** is confidential and not for public distribution.

a.i, a.ii) The NAHC maintains a confidential SLF, which contains records of sites of traditional, cultural, or religious value to the Native American community. The NAHC was contacted on November 2, 2021, to request a search of the SLF. The NAHC responded to the request in a letter dated December 16, 2021, with the results of the SLF search conducted by the NAHC, which indicated a negative search result. The NAHC provided a list of tribes who could be contacted for information regarding known and recorded sites.

Additionally, a records search was received from the SCCIC on December 7, 2021, and archival research was done in house to determine whether the study area contains any recorded cultural resources that have been previously identified or evaluated. This includes data on prehistoric sites, historic sites, multicomponent sites, prehistoric isolates, historic period isolates, and historic built resources within the project site and a 0.5-mile radius around it.

The records search included a review of all recorded archaeological resources and previous studies within a 0.5-mile radius of the project site. The records search results indicate five cultural resources studies have been conducted within the records search radius. The entirety of the 0.5-mile records search radius has been included in previous cultural resources studies. Of the five previous studies, one (LA-04512) overlaps the entirety of the project site. This study is a cultural resources inventory of the City conducted in 1977 and included extensive archival research and field survey of accessible parcels within the City.

In reviewing the report, it is difficult to discern if the project site was included as part of the inventory's field survey. The records search revealed that one cultural resource (P-19-188395) has been previously recorded within the 0.5-mile radius of the project site. This resource is a historic-period built environment resource consisting of the Shell Oil Refinery complex located approximately 0.20 miles north of the project site. No resources have been recorded within the project site. A survey of the project site further did not result in the recordation of any additional resources.

Pursuant to the requirements of AB 52 requiring government-to-government consultation, the City, as the lead agency, sent consultation notification letters via e-mail and certified U.S. mail to Native American groups geographically and culturally affiliated with the project site on October 28, 2021. The letters included a description of the proposed project, the description of the project location, and a notification of the type of consultation being initiated. To date, the City has received one response from the Native American groups regarding consultation, the details of which are provided below.

Pursuant to SB 18, the City contacted the NAHC to request the list of tribes who should be consulted regarding the proposed projects. The City has reached out to the list of tribes and is engaging in consultation with any tribes requesting SB 18 consultation.

As indicated above, only one response was received. The Gabrieleño Band of Mission Indians-Kizh Nation responded on November 10, 2021, stating that the project site is located within the tribe's traditional ancestral territory and requested formal government-to-government consultation. The Gabrieleño Band of Mission Indians-Kizh Nation provided in a subsequent email and during phone call consultations historic topo maps of the project site as well as information regarding the Rancho San Pedro, local Native American villages, and information regarding the Dominguez Wash. The Gabrieleño Band of Mission Indians-Kizh Nation indicated that the project site is archaeologically sensitive, but did not identify any known tribal cultural resources (as defined in Public Resources Code Section 21074) within the project site. The Tribe recommended monitoring during construction and the City agreed with this recommendation and the Tribe and the City agreed to monitoring mitigation. The Tribe provided mitigation measures for tribal cultural resources as well as human remains they would like used for the project and the City adapted for the project. Upon approval from the Tribe of the mitigation measures, the City closed consultation on Monday, March 28, 2022.

Although no substantial evidence was provided to support the Kizh Tribal claim that any known sacred lands or tribal cultural resources overlap with or occur within the project site outside of the previously remediated areas, the City's review of the Kizh Tribal information concludes that the project site has potentially high sensitivity for buried archaeological resources (outside or below the previous remediation areas) that, once encountered, could potentially be considered a tribal cultural resource as defined in Public Resources Code Sections 21074, 5020.1(k), or 5024.1.

Should any unanticipated prehistoric archaeological resources be determined during consultation between the Tribes and the City to potentially be tribal cultural resources, Public Resources Code Section 21084.3 would apply. Should the lead agency (City) determine that the project may cause a substantial adverse change to a tribal cultural resource, the agency will need to consider avoidance and preservation of the resources as well as mitigation measures outlined in Public Resources Code Section 21084.3(b)(1)–(4), which can be considered to avoid or minimize the significant adverse impacts. As stated above, as required by AB 52, consultation between the City and the Gabrieleño Band of Mission Indians-Kizh Nation was conducted. No identified tribal cultural resources as defined in Public Resources Code Section 21074(a)(1) that are listed or eligible for listing in the California Register of Historical Resources, or in a local register of historical resources as defined in Public Resources Code Section 5020.1 (k) have been identified within the project site. However, implementation of Mitigation Measure MM-TCR-1 would avoid and/or substantially lessen the above impact by ensuring that any unanticipated tribal cultural resources are appropriately identified, documented, evaluated, and treated promptly, so they are not inadvertently damaged or destroyed. With implementation of Mitigation Measure MM TCR-1, the impact to any unanticipated tribal cultural resources would be less than significant.

The following mitigation measures are also required to address potentially significant impacts to tribal cultural resources.

Mitigation Measure

MM-TCR-1. Retain a Native American Monitor Prior to Commencement of Ground-Disturbing Activities.

A. The project applicant/lead agency shall retain a Native American Monitor from or approved by the Gabrieleño Band of Mission Indians – Kizh Nation. The monitor shall be retained prior to the commencement of any "ground-disturbing activity" for the subject project at all project locations (i.e., both on-site and any off-site locations that are included in the project description/definition and/or required in connection with the project, such as public improvement work) outside or below the previous remediation areas. "Ground disturbing activity" shall include, but is not limited to, demolition, pavement removal, potholing, auguring, grubbing, tree removal, boring, grading, excavation, drilling, and trenching.

B. A copy of the executed monitoring agreement shall be submitted to the lead agency prior to the commencement of any ground-disturbing activity, or the issuance of any permit necessary to commence a ground-disturbing activity.

C. The monitor will complete daily monitoring logs that will provide descriptions of the relevant ground-disturbing activities, the type of construction activities performed, locations of ground disturbing activities, soil types, cultural-related materials, and any other facts, conditions, materials, or discoveries of significance to the Tribe. Monitor logs will identify and describe any discovered tribal cultural resources (TCRs), including but not limited to, Native American cultural and historical artifacts, remains, places of significance, etc., (collectively, tribal cultural resources, or "TCR"), as well as any

discovered Native American (ancestral) human remains and burial goods. Copies of the monitor logs will be provided to the project applicant/lead agency.

D. On-site tribal monitoring shall conclude upon the latter of the following (1) written confirmation to the Kizh Nation from a designated point of contact for the project applicant/lead agency that all ground-disturbing activities and phases that may involve ground-disturbing activities on the project site or in connection with the project are complete; or (2) a determination and written notification by the Kizh Nation to the project applicant/lead agency that no future, planned construction activity and/or development/construction phase at the project site possesses the potential to impact Kizh Nation TCRs.

E. Upon discovery of any TCRs, all construction activities in the immediate vicinity of the discovery shall cease (i.e., not less than the surrounding 50 feet) and shall not resume until the discovered TCR has been fully assessed by the Kizh Nation monitor. A meeting shall take place between the Applicant, the qualified Archaeologist, the Kizh Nation, and the City to discuss the significance of the find and whether it qualifies as a tribal cultural resource pursuant to Public Resources Code Section 21074(a) and appropriate treatment under CEQA. The Project Archaeologist shall provide a treatment plan as recommended in Mitigation Measure CUL-MM-1, that shall incorporate the monitoring Kizh Nation's treatment and curation recommendations. The preferred treatment under CEQA is avoidance, but if not feasible, may include, but would not be limited to, capping in place, excavation and removal of the resource and follow-up laboratory processing and analysis, interpretive displays, sensitive area signage, or other mutually agreed upon measures. The Kizh Nation will recover and retain all discovered TCRs in the form and/or manner the Kizh Nation deems appropriate, at the Kizh Nation's sole discretion, and for any purpose the Kizh Nation deems appropriate, including for educational, cultural, and/or historic purposes.

XIX. Utilities and Service Systems

Issues (and Supporting Information Sources)	*Potentially Significant Impact*	*Less than Significant with Mitigation Incorporated*	*Less-than-Significant Impact*	*No Impact*
XIX. UTILITIES AND SERVICE SYSTEMS—Would the project:				
a) Require or result in the relocation or construction of new or expanded water, wastewater treatment or storm water drainage, electric power, or telecommunications facilities, the construction or relocation of which could cause significant environmental effects?	☐	☐	☒	☐
b) Have sufficient water supplies available to serve the project and responsibly foreseeable future development during normal, dry and multiple dry years?	☐	☐	☒	☐
c) Result in a determination by the wastewater treatment provider which serves or may serve the project that it has adequate capacity to serve the project's projected demand in addition to the provider's existing commitments?	☐	☐	☒	☐
d) Generate solid waste in excess of State or local standards, or in excess of the capacity of local infrastructure, or otherwise impair the attainment of solid waste reduction goals?	☐	☐	☒	☐
e) Comply with federal, State, and local management and reduction statutes and regulations related to solid waste?	☐	☐	☒	☐

This impact analysis presented in this section is informed, in part, by the Utilities Memorandum provided in **Appendix I** of this IS/MND.

Discussion

a) ***Water***

Construction

During construction activities, there would be a temporary, intermittent demand for water for such activities as soil watering for site preparation, fugitive dust control, concrete preparation, painting, cleanup, and other short-term activities. Construction-related water usage is not expected to have an adverse impact on available water supplies, and impacts would be less than significant.

As detailed in the Utilities Memorandum, the proposed project would require the installation of water distribution lines and minor work associated with lateral connections to the public water main. Project contractors would be required to coordinate with Cal Water Dominguez District and the County of Los Angeles prior to construction. Ground disturbance associated with the expansion of these water distribution lines is analyzed throughout this environmental document. With implementation of mitigation measures within this document, construction impacts associated with the proposed expanded water lines would be less than significant.

Operation

No new sources of water supply, such as groundwater, are required to meet the proposed project's water demand. Potable water would be supplied by the Cal Water Dominguez

District. Based on the 2020 Urban Water Management Plan (UWMP), the Cal Water Dominguez District receives its water from 17 percent groundwater, 15 percent recycled water, and 68 percent purchased water (California Water Service 2020).

While the self-storage facilities would not contain any water fixtures, the proposed retail uses and landscaping would contribute to the proposed project's operational water demand. As detailed in the Utilities Memorandum, the total water demand generated by the proposed project would be 1.85 acre-feet per year (AFY). However, as fire water demand will create a much greater immediate impact on the water network as compared to the proposed project's domestic uses, the primary means for analyzing infrastructure capacity is based on fire water demand. As further described in the Utilities Memorandum, Furthermore, a regional fire Hydrant Flow Test was performed by Cal Water for the existing hydrant on the west side of Perry Street, within the immediate vicinity of the project site, which confirms the available pressure and capacity of the existing fire hydrant is sufficient (refer to **Appendix I** of this IS/MND). Furthermore, Cal Water has confirmed that adequate water services are available to serve the proposed project from existing commitments (refer to **Appendix I** of this IS/MND). Therefore, operation-related water usage would not have an adverse impact on available water supplies, and impacts would be less than significant.

Wastewater Treatment

Construction

Construction activities for the proposed project would not result in wastewater generation as construction workers would utilize portable restrooms, which would not contribute to wastewater flows to the local wastewater system. Therefore, no impact would occur related to wastewater treatment generation during construction.

As detailed in the Utilities Memorandum, the proposed project would require construction of new wastewater infrastructure to serve the proposed buildings, consisting of minor work to connect to the public sewer main. Ground disturbance associated with the expansion of these sewer lines is analyzed throughout this environmental document. With implementation of mitigation measures within this document, construction impacts associated with the proposed expanded sewer lines would be less than significant.

Operation

The Los Angeles County Sanitation Districts (LACSD) provide wastewater treatment for much of Los Angeles County including the project site. LACSD has confirmed service to the project site via a will serve letter provided in **Appendix I** of this IS/MND. Wastewater generated by the proposed project would be treated at the LACSD's Joint Water Pollution Control Plant (JWPCP) located in the City of Carson, which has a capacity of 400 million gallons per day (mgd) and currently processes an average flow of 261.1 mgd (LACSD 2008). The capacity of this facility is limited to levels associated with approved growth identified by the SCAG. In addition, payment of a standard sewer connection fee and ongoing user fees would be required to ensure that sufficient capacity is available.

As detailed in the Utilities Memorandum, the proposed project would contribute 12,250 gallons per day (GPD) of wastewater, which is a negligible wastewater generation compared to the available capacity at the JWPCP. In addition, payment of standard sewer connection fees and ongoing user fees would ensure that sufficient capacity is available. Therefore, it is not anticipated that project implementation would require construction of new or the expansion of existing wastewater facilities and impacts would be less than significant.

Stormwater

As discussed above in Section X, *Hydrology and Water Quality*, the project site drains towards the west to an existing 5-foot storm drain inlet that outlets directly to the Dominguez Channel. Under the proposed project, the project site would drain from east to west via gutters that wrap around the proposed buildings. The runoff generated would be treated by a 10 foot by 20-foot Modular Wetland System that would discharge via an 18-inch pipe to the existing 5-foot storm drain inlet, as under existing conditions In addition, the proposed project would be required to complete a SWPPP in accordance with the NPDES, which would reduce the potential for stormwater impacts on- and off-site. Furthermore, once implementation of the proposed project is complete, the project site would contain approximately 10.2 percent landscaped areas. Therefore, impacts related to stormwater drainage would be less than significant.

Electric Power, Natural Gas, and Telecommunications

The project site is located in an urbanized area of the City of Carson and is currently vacant and undeveloped. The project site was previously developed and historically served by electric power, natural gas, and telecommunications providers that still exist in the vicinity of the project site. With regard to existing electrical distribution lines, the proposed project would be required to coordinate electrical infrastructure removals or relocations with SCE and comply with site-specific requirements set forth by SCE, which would ensure that service disruptions and potential impacts associated with grading, construction, and development within SCE easements would be minimized. As described in the Utilities Memorandum, development of the proposed project would require the construction of a transformer pad. In addition, the proposed project would also be required to coordinate with SoCalGas to identify the locations and depth of all existing gas lines and avoid disruption of gas service to other properties. Furthermore, the proposed project would implement any necessary connections and upgrades required by SoCalGas to ensure that SoCalGas would be able to adequately serve the proposed project. With regard to telecommunication, the proposed project would be required to coordinate with AT&T to connect services to the project site. Specifically, a tie in overhead at the existing overhead line on East Carson Street would be required. Well serve letters from these utilities are provided in **Appendix I** of this IS/MND. Implementation of the proposed project would not require the extension of or new electric power, natural gas, and telecommunication infrastructure and there would be no impact.

b) The proposed project would have sufficient water supplies available to serve the project site and responsibly foreseeable future development during normal, dry and multiple dry

years. As detailed above in Section XIX (a) and as detailed in the Utilities Memorandum, the total water demand for the proposed project would be 1.85 AFY Cal Water has confirmed that adequate water services are available to serve the proposed project from existing commitments (refer to **Appendix I** of this IS/MND). Therefore, water usage would not have an adverse impact on available water supplies, and impacts would be less than significant.

c) The JWPCP serves the project site and the capacity of this facility is limited to levels associated with approved growth identified by the SCAG. As discussed above in response to Section XIX (a), the proposed project would contribute 12,250 GPD of wastewater, which is a negligible increase compared to the available capacity of 138.9 mgd at the JWPCP.[8] In addition, payment of standard sewer connection fees and ongoing user fees would ensure that sufficient capacity is available. Therefore, a less-than-significant impact would occur.

d) A substantial amount of solid waste is disposed of throughout the region, requiring ongoing landfill expansions. According to the City of Carson General Plan, solid waste generated by industrial, commercial, and residential uses in the City is collected by Waste Management. Waste Management collects an estimated 153,500 tons from commercial and industrial customers per year. Solid waste collected by Waste Management is transported to the Carson Transfer Station and Materials Recovery where it is sorted by material type. The 10-acre facility has a permitted capacity of 5,300 tons per day. Once the materials have been sorted, tires, green waste, steel, and wood are diverted to special facilities for disposal and recycling. Excess solid waste is sent to El Sobrante Landfill in Riverside County, approximately 75 miles from the City. Waste Management also disposes solid waste to Lancaster Landfill and Simi Valley Landfill as alternates. The total permitted throughput for all landfills is 30,404 tons per day, and approximately 249 million cubic yards of capacity remain (CalRecycle 2022). As under existing conditions, solid waste would be collected by Waste Management and taken to the appropriate Sanitation Districts of Los Angeles County landfill with remaining capacity. Landfills operated by Sanitation Districts of Los Angeles County are subject to federal and State programs that regulate operations and capacity in consideration of solid waste reduction goals.

In addition, according to the 2021 Annual Report for the Countywide Integrated Waste Management Plan (CIWMP), the remaining capacity at County-operated landfills is 129.19 million tons (County of Los Angeles 2021). Construction of the proposed project would generate solid waste including wood, metals, soils, and other construction-related materials. However, as required by the Construction and Demolition Debris Recycling and Reuse Program (C&D) Program, the proposed project would be required to divert a minimum of 65 percent of C&D waste from landfills. As the proposed project would be required to divert 65 percent of solid waste from landfills, the remaining capacity of County-operated landfills would be minimally affected due to construction.

[8] Available capacity derived from the total capacity of 400 million mgd subtracted by 261.1 mgd average flow currently processed at the JWPCP.

All collection, transportation, and disposal of any solid waste generated by the proposed project during construction and operation would comply with all applicable federal, State, and local statutes and regulations. In particular, AB 939 requires that at least 50 percent of solid waste generated by a jurisdiction be diverted from landfill disposal through source reduction, recycling, or composting. Cities, counties, and regional agencies are required to develop a waste management plan that would achieve a 50 percent diversion from landfills (Public Resources Code Section 40000 et seq.). Furthermore, as required by existing regulations, any hazardous materials collected on the project site during demolition, construction, or operational activities would be transported and disposed of by a permitted and licensed hazardous materials service provider at a facility permitted to accept such hazardous materials. As such, the proposed project is not anticipated to generate solid waste in excess of State or local standards, or in excess of the capacity of local infrastructure, or otherwise impair the attainment of solid waste reduction goals. Therefore, this impact would be less than significant.

e) The project site is subject to State and City mandates with respect to solid waste, such as implementation of the City's Diversion and Recycling Program. The proposed project would comply with all federal, State, and local statutes and regulations related to solid waste, including the California Integrated Waste Management Act and City requirements for solid waste generated during project construction and operation. Compliance with these regulations would ensure that a less-than-significant impact would occur.

XX. Wildfire

Issues (and Supporting Information Sources)	*Potentially Significant Impact*	*Less than Significant with Mitigation Incorporated*	*Less-than-Significant Impact*	*No Impact*
XX. WILDFIRE—If located in or near state responsibility areas or lands classified as very high fire hazard severity zones, would the project:				
a) Substantially impair an adopted emergency response plan or emergency evacuation plan?	☐	☐	☒	☐
b) Due to slope, prevailing winds, and other factors, exacerbate wildfire risks, and thereby expose project occupants to, pollutant concentrations from a wildfire or the uncontrolled spread of a wildfire?	☐	☐	☐	☒
c) Require the installation or maintenance of associated infrastructure (such as roads, fuel breaks, emergency water sources, power lines or other utilities) that may exacerbate fire risk or that may result in temporary or ongoing impacts to the environment?	☐	☐	☐	☒
d) Expose people or structures to significant risks, including downslope or downstream flooding or landslides, as a result of runoff, post-fire slope instability, or drainage changes?	☐	☐	☐	☒

Discussion

a) As noted previously, the project site is not within a Very High Fire Hazard Severity Zone. As analyzed in Section IX, *Hazards and Hazardous Materials*, above, while primary access to the project site would be provided from South Perry Street, vehicles travelling to the project site during construction or operation would do so via East Carson Street, a City designated evacuation route as identified in the Multi-Hazard Functional Plan for emergency response within the City (City of Carson 2004). During construction, East Carson Street may require temporary partial lane closures. The Applicant would be required to implement a traffic management plan, which would ensure that at least one lane remains open and emergency access is maintained during construction. In addition, the vehicle trips generated are not anticipated to impact emergency access provided from East Carson Street, and operations are not likely to interfere with an adopted emergency response plan or emergency evacuation plan. Therefore, impacts related to impairing an emergency response or evacuation plan would be less than significant.

b) The project site is located in an urbanized area and would continue to be served by the LACFD. According to CAL FIRE, the proposed project is not located within a Very High Fire Hazard Severity Zone (CAL FIRE 2022). Therefore, the proposed project would not expose people to significant pollutant concentrations resulting from wildland fires, or the uncontrolled spread of a wildfire. Therefore, no impacts related to exacerbating wildfire risks due to slope, prevailing winds, and other factors would occur.

c) As described above, the proposed project would not require the installation or maintenance of associated infrastructure that may exacerbate fire risk. While the project site is currently vacant and undeveloped, the project site would connect to existing power lines and utilities already in the vicinity of the project site. As the proposed project would be constructed in

compliance with the CBC and CFC, and given that the project site is not located in a Very High Fire Hazard Severity Zone (CAL FIRE 2022), project implementation would not exacerbate fire risks or result in ongoing environmental impacts. Therefore, no impacts related to exacerbating wildfire risks as a result of installation or maintenance of associated infrastructure would occur.

d) As described above, the project site is located in an urbanized area, and would continue to be served by the LACFD. Additionally, according to CAL FIRE, the project site is not located within a Very High Fire Hazard Severity Zone (CAL FIRE 2022). Given the local topographic and environmental characteristics of the project site, the proposed project would not increase the possibility of wildland fire in the project vicinity.

Additionally, no streams, rivers or natural drainages occur on the project site. Due to the relatively flat topography of the project site and surrounding area, the project site would not expose people or structures to flooding or potential landslides. Therefore, no impacts would occur related to exposing people or structures to significant risk.

XXI. Mandatory Findings of Significance

Issues (and Supporting Information Sources)	*Potentially Significant Impact*	*Less than Significant with Mitigation Incorporated*	*Less-than-Significant Impact*	*No Impact*
XXI. MANDATORY FINDINGS OF SIGNIFICANCE				
a) Does the project have the potential to substantially degrade the quality of the environment, substantially reduce the habitat of a fish or wildlife species, cause a fish or wildlife population to drop below self-sustaining levels, threaten to eliminate a plant or animal community, substantially reduce the number or restrict the range of a rare or endangered plant or animal or eliminate important examples of the major periods of California history or prehistory?	☐	☒	☐	☐
b) Does the project have impacts that are individually limited but cumulatively considerable? ("Cumulatively considerable" means that the incremental effects of a project are considerable when viewed in connection with the effects of past projects, the effects of other current projects, and the effects of probable future projects)?	☐	☒	☐	☐
c) Does the project have environmental effects which will cause substantial adverse effects on human beings, either directly or indirectly?	☐	☒	☐	☐

Discussion

a) The proposed project is a self-storage facility consisting of approximately 113,714 square feet in a mix of one- and two-story buildings. As discussed in Section IV, *Biological Resources*, the proposed project does not have the potential to degrade the quality of the environment, substantially reduce the habitat of a fish and wildlife species, cause a fish, or wildlife population to drop below self-sustaining levels, threaten to eliminate a plant or animal community, reduce the number or restrict the range of rare or endangered plant or animals. As indicated in Section V, *Cultural Resources*, in the event that historical resources, archaeological resources, or human remains are encountered during construction, Mitigation Measures MM-CULT-1 and MM-CULT-2 would require all project construction activities to halt until qualified experts identify the significance of the find and recommend a course of action. Furthermore, to reduce impacts to tribal cultural resources, the proposed project would implement Mitigation Measure MM-TCR-1. Therefore, the proposed project would not potentially degrade the quality of the environment, substantially reduce the habitat of a fish or wildlife species, cause a fish or wildlife population to drop below self-sustaining levels, threaten to eliminate a plant or animal community, reduce the number or restrict the range of a rare or endangered plant or animal, or eliminate important examples of the major periods of California history or prehistory. Therefore, a less-than-significant impact would occur with mitigation.

b) A significant impact may occur if the proposed project, in conjunction with the related projects, would result in impacts that are significant when taken together. With the incorporation of mitigation, the proposed project would have less-than-significant or no impacts with respect to all environmental topics, as discussed in the above checklist. Related projects would also be required to mitigate any impacts to the maximum extent

feasible. Therefore, with mitigation incorporated, the proposed project together with related projects would not result in significant cumulative impacts.

c) A significant impact may occur if the proposed project has the potential to result in significant impacts, as discussed in the preceding sections. All potential impacts of the proposed project have been identified, and mitigation measures have been prescribed, where applicable, to reduce all potential impacts to less-than-significant levels. The proposed project would comply with all applicable permits, regulations, and other conditions imposed by the City of Carson and responsible agencies. Therefore, impacts associated with the proposed project would be less than significant.

CHAPTER 4
Response to Comments

4.1 Introduction

The City of Carson (City) prepared a Draft Initial Study/Mitigated Negative Declaration (IS/MND) for the 21611 Perry Street Self-Storage project (proposed project) (State Clearinghouse [SCH] No. 2022050571), which was circulated for a 30-day public review period pursuant to requirements of the California Environmental Quality Act (CEQA) Guidelines Chapter 3, Section 15073(a). The review period gives agencies, organizations, and members of the public the opportunity to review the Draft IS/MND and provide comments on the document and the environmental analysis presented therein. The 30-day review period commenced on May 26, 2022, and ended on June 27, 2022. During the review period, the City received one letter from a state agency commenting on the Draft IS/MND. The comment letter was provided by the California Department of Transportation (Caltrans) on June 17, 2022.

Making Conservation a California Way of Life

June 17, 2022

Stefanie Edmondson, Senior Planner
Community Development Department
City of Carson
701 East Carson street
Carson, CA 90745

RE: 21611 Perry Street Self-Storage Project
SCH # 2022050571
Vic. LA-405/PM 10.56
GTS # LA-2021-03966-MND

Dear Stefanie Edmondson:

Thank you for including the California Department of Transportation (Caltrans) in the environmental review process for the above referenced environmental document. The proposed project includes the development of a self-storage facility with three buildings totaling approximately 113,714 square feet. The self-storage facility would be comprised of a mix of one- and two-story buildings with a maximum height of 31 feet. The self-storage facility would include a 2,425 square foot lobby/self-storage office area, a 1,550 square foot retail use for a cafe, and a 700 square foot retail use (likely a mail service store such as a UPS or FedEx) comprising a total of 4,675 square feet for these uses. The proposed project would provide 41 parking spaces that would be accessed from one driveway providing ingress/egress off South Perry Street. A-1

The mission of Caltrans is to provide a safe and reliable transportation network that serves all people and respects the environment. Senate Bill 743 (2013) has codified into CEQA law and mandated that CEQA review of transportation impacts of proposed development be modified by using Vehicle Miles Traveled (VMT) as the primary metric in identifying transportation impacts for all future development projects. You may reference the Governor's Office of Planning and Research (OPR) for more information: A-2

http://opr.ca.gov/ceqa/updates/guidelines/

As a reminder, VMT is the standard transportation analysis metric in CEQA for land use projects after July 1, 2020, which is the statewide implementation date.

"Provide a safe and reliable transportation network that serves all people and respects the environment"

Letter A: California Department of Transportation

Comment Letter A

Stefanie Edmondson, Senior Planner
June 17, 2022
Page 2 of 3

Caltrans is aware of challenges that the region faces in identifying viable solutions to alleviating congestion on State and Local facilities. With limited room to expand vehicular capacity, all future developments should incorporate multi-modal and complete streets transportation elements that will actively promote alternatives to car use and better manage existing parking assets. Prioritizing and allocating space to efficient modes of travel such as bicycling and public transit can allow streets to transport more people in a fixed amount of right-of-way.

Caltrans supports the implementation of complete streets and pedestrian safety measures such as road diets and other traffic calming measures. Please note the Federal Highway Administration (FHWA) recognizes the road diet treatment as a proven safety countermeasure, and the cost of a road diet can be significantly reduced if implemented in tandem with routine street resurfacing. Overall, the environmental report should ensure all modes are served well by planning and development activities. This includes reducing single occupancy vehicle trips, ensuring safety, reducing vehicle miles traveled, supporting accessibility, and reducing greenhouse gas emissions.

A-3

The Technical Advisory on Evaluating Transportation Impacts in CEQA (Office of Planning and Research 2018) was used to conduct the VMT analysis pursuant to CEQA Guidelines Section 15064.3, Subdivision (b). Based on the proposed project characteristics, it can be classified as local-serving retail. As described in the Technical Advisory, local-serving retail can be screened from a quantitative VMT analysis for CEQA purposes:

"By adding retail opportunities into the urban fabric and thereby improving retail destination proximity, local-serving retail development tends to shorten trips and reduce VMT."

Based on the above, the proposed project would not conflict with CEQA Guidelines Section 15064.3, Subdivision (b), and the impact would be less than significant.

Given the above finding of less than significant Project VMT impact, Caltrans concurs the finding at this time. However, a post-development VMT analysis for this land use with additional mitigation measures is highly recommended for monitoring/validation purpose and for future project thresholds in the area. Additional mitigation measure should be implemented when the post-development VMT analysis discloses any traffic significant impact.

A-4

Storm water run-off is a sensitive issue for Los Angeles and Ventura counties. Please be mindful that projects should be designed to discharge clean run-off water. Additionally, discharge of storm water run-off is not permitted onto State highway facilities without any storm water management plan.

A-5

"Provide a safe and reliable transportation network that serves all people and respects the environment"

Letter A: California Department of Transportation

Comment Letter A

As a reminder, any transportation of heavy construction equipment and/or materials which requires use of oversized-transport vehicles on State highways will need a Caltrans transportation permit. We recommend large size truck trips be limited to off-peak commute periods. A-6

If you have any questions, please feel free to contact Mr. Alan Lin the project coordinator at (213) 269-1124 and refer to GTS # LA-2021-03966-MND. A-7

Sincerely,

Miya Edmonson

MIYA EDMONSON
LDR/CEQA Branch Chief

email: State Clearinghouse

4.3 Response to Comments

Comment Letter A: California Department of Transportation

Response to Comment A-1

This comment thanks the lead agency for the being able to review the 21611 Perry Street Self-Storage MND. The comment includes a description of the proposed project and does not specifically address the adequacy of the Draft IS/MND; therefore, no specific response is required.

Response to Comment A-2

This comment introduces the mission of Caltrans in providing a safe and reliable transportation network and the CEQA mandated review of VMT in determining transportation impacts. As the comment does not raise any specific issues regarding the content or adequacy of the Draft EIR, no further response is warranted.

Response to Comment A-3

This comment discusses the challenges in identifying viable solutions to alleviating congestion on State and Local facilities and recommends the incorporation of multi-modal and complete streets transportation elements that will actively promote alternatives to car use and better management existing parking assets. Measures to implement complete streets include road diets and other traffic calming measures. As the comment does not raise any specific issues regarding the content or adequacy of the Draft EIR, no further response is warranted.

Response to Comment A-4

This comment concurs with the findings provided in the Draft IS/MND as it relates to the analysis for Threshold b), which relates to CEQA Guidelines Section 15064.3, Subdivision (b). A discussed on page 100 of the Draft IS/MND, based on the proposed project characteristics, the proposed project can be classified as local-serving retail. As described in Office of Planning and Research's Technical Advisory on Evaluating Transportation Impacts in CEQA, local-serving retail can be screened from a quantitative VMT analysis for CEQA purposes. As such, the proposed project would not conflict with CEQA Guidelines Section 15064.3, Subdivision (b), and the impact would be less than significant This comment also suggests that a post-development VMT analysis is recommended for monitoring/validation purposes and future project thresholds in the area. While this comment does not address the adequacy of the Draft IS/MND, the City will consider the request for post-development VMT analysis.

Response to Comment A-5

This comment states that storm water run-off is a sensitive issue and that projects should be designed to discharge clean run-off water. As stated in the Draft IS/MND, under the proposed project, the project site would drain from east to west via gutters that wrap around the proposed buildings. The runoff generated would be treated by a 10 foot by 20-foot Modular Wetland System that would discharge via an 18-inch pipe to the existing 5-foot storm drain inlet, as under existing conditions. Storm water would not drain onto any State highways facilities.

Response to Comment A-6

This comment regarding oversized trucks requiring a permit is noted. Because this comment does not raise a substantive issue on the content of the Draft EIR, no further response is warranted.

Response to Comment A-7

This comment provides Caltrans contact information in the event additional information is needed. As the comment does not raise any specific issues regarding the content or adequacy of the Draft IS/MND, no further response is warranted.

CHAPTER 5
Mitigation Monitoring and Reporting Program

5.1 Introduction

This Mitigation Monitoring and Reporting Program (MMRP) has been prepared in accordance with Public Resources Code Section 21081.6 and CEQA Guidelines Section 15091(d), which require a public agency to adopt a program for monitoring or reporting on the changes it has required in the project or conditions of approval to substantially lessen significant environmental effects. Specifically, Public Resources Code Section 21081.6 states: "… the [lead] agency shall adopt a reporting or monitoring program for the changes made to the project or conditions of project approval, adopted in order to mitigate or avoid significant effects on the environment … The … program … shall be designed to ensure compliance during project implementation." The City of Carson, specifically the Planning Division of the Community Development Department, is the Lead Agency for the proposed project.

The MMRP describes the procedures for the implementation of all of the mitigation measures identified in the IS/MND for the proposed project. Mitigation measures set forth in the MMRP are specific and enforceable and are capable of being fully implemented by the City of Carson, the various applicants, and/or other identified public agencies of responsibility.

5.2 Mitigation Measures

Mitigation Measures	Monitoring Phase	Implementing Party	Enforcement Agency	Responsible Monitoring Agency
BIOLOGICAL RESOURCES				
MM-BIO-1: Pre-construction (vegetation removal) avian nesting surveys shall be conducted during the breeding season. A qualified avian biologist shall conduct these surveys within 7 days of vegetation and tree removal. The surveying biologist must be qualified to determine the species, status, and nesting stage without causing intrusive disturbance. The survey shall cover all reasonably potential nesting locations on and within 300 feet of the project site. If active nests are found, a no-disturbance buffer (300 feet for raptors and 50 feet for other birds, or as otherwise determined in consultation with CDFW shall be created around the active nests. If construction is scheduled to occur during the non-nesting season (August 16 to January 31), no preconstruction surveys or additional measures are required.	Prior to construction during the bird nesting season/ Pre-Construction	Applicant	City of Carson Department of Community Development, Planning Division	City of Carson Department of Community Development, Planning Division
CULTURAL RESOURCES				
MM-CULT-1: Prior to issuance of demolition permit, the Applicant shall retain a qualified Archaeologist who meets the Secretary of the Interior's Professional Qualifications Standards (Qualified Archaeologist) to oversee an archaeological monitor who shall be present during construction excavations such as demolition, clearing/grubbing, grading, trenching, or any other construction excavation activity associated with the proposed project that occur outside or below the remediation areas. The frequency of monitoring shall be based on the rate of excavation and grading activities, proximity to known archaeological resources, the materials being excavated (younger alluvium vs. older alluvium), and the depth of excavation, and if found, the abundance and type of archaeological resources encountered, as determined by the Qualified Archaeologist. Full-time field observation can be reduced to part-time inspections or ceased entirely if determined appropriate by the Qualified Archaeologist. Prior to commencement of excavation activities, an Archaeological and Cultural Resources Sensitivity Training shall be given for construction personnel. The training session, shall be carried out by the Qualified Archaeologist and shall focus on how to identify archaeological and cultural	Prior to issuance of a demolition permit/Pre-Construction	Applicant	City of Carson Department of Community Development, Building and Safety Division	City of Carson Department of Community Development, Building and Safety Division

Mitigation Measures	Monitoring Phase	Implementing Party	Enforcement Agency	Responsible Monitoring Agency
resources that may be encountered during earthmoving activities and the procedures to be followed in such an event. In the event that historic or prehistoric archaeological resources (e.g., bottles, foundations, refuse dumps, Native American artifacts or features, etc.) are unearthed, ground-disturbing activities shall be halted or diverted away from the vicinity of the find so that the find can be evaluated. An appropriate buffer area shall be established by the Qualified Archaeologist around the find where construction activities shall not be allowed to continue. Work shall be allowed to continue outside of the buffer area. All archaeological resources unearthed by project construction activities shall be evaluated by the Qualified Archaeologist and a Gabrieleño Band of Mission Indians – Kizh Nation Monitor. If the resources are Native American in origin, the Kizh Nation shall consult with the City and Qualified Archaeologist regarding the treatment and curation of any prehistoric archaeological resources. If a resource is determined by the Qualified Archaeologist to constitute a "historical resource" pursuant to CEQA Guidelines Section 15064.5(a) or a "unique archaeological resource" pursuant to Public Resources Code Section 21083.2(g), the Qualified Archaeologist shall coordinate with the Applicant and the City to develop a formal treatment plan that would serve to reduce impacts to the resources. The treatment plan established for the resources shall be in accordance with CEQA Guidelines Section 15064.5(f) for historical resources and Public Resources Code Section 21083.2(b) for unique archaeological resources. The treatment plan shall incorporate the Kizh Nation's treatment and curation recommendations. Preservation in place (i.e., avoidance) is the preferred manner of treatment. If preservation in place is not feasible, treatment may include implementation of archaeological data recovery excavations to remove the resource along with subsequent laboratory processing and analysis. The treatment plan shall include measures regarding the curation of the recovered resources that may include curation at a public, non-profit institution with a research interest in the materials, such as the Natural History Museum of Los Angeles County or the Fowler Museum, if such an institution agrees to accept the material and/or the Kizh Nation. If no institution or the Kizh Nation accepts the resources, they may be donated to a local school or historical society in the area (such as the Culver City Historical Society) for educational purposes.				

Mitigation Measures	Monitoring Phase	Implementing Party	Enforcement Agency	Responsible Monitoring Agency
Prior to the release of the grading bond, the Qualified Archaeologist shall prepare a final report and appropriate California Department of Parks and Recreation Site Forms at the conclusion of archaeological monitoring. The report shall include a description of resources unearthed, if any, treatment of the resources, results of the artifact processing, analysis, and research, and evaluation of the resources with respect to the California Register of Historical Resources and CEQA. The report and the Site Forms shall be submitted by the Applicant to the City, the South Central Coastal Information Center, and representatives of other appropriate or concerned agencies to signify the satisfactory completion of the proposed project and required mitigation measures.				
MM-CULT-2: If human remains are encountered unexpectedly during implementation of the proposed project, State Health and Safety Code Section 7050.5 requires that no further disturbance shall occur until the County Coroner has made the necessary findings as to origin and disposition pursuant to Public Resources Code Section 5097.98. If the remains are determined to be of Native American descent, the coroner has 24 hours to notify the NAHC. The NAHC shall then identify the person(s) thought to be the Most Likely Descendent (MLD). The MLD may, with the permission of the land owner, or his or her authorized representative, inspect the site of the discovery of the Native American remains and may recommend to the owner or the person responsible for the excavation work means for treating or disposing, with appropriate dignity, the human remains and any associated grave goods. The MLD shall complete their inspection and make their recommendation within 48 hours of being granted access by the land owner to inspect the discovery. The recommendation may include the scientific removal and nondestructive analysis of human remains and items associated with Native American burials. Upon the discovery of the Native American remains, the landowner shall ensure that the immediate vicinity, according to generally accepted cultural or archaeological standards or practices, where the Native American human remains are located, is not damaged or disturbed by further development activity until the landowner has discussed and conferred, as prescribed in this mitigation measure, with the MLD regarding their recommendations, if applicable, taking into account the possibility of multiple human remains. The landowner shall discuss and confer with the descendants all reasonable options regarding the descendants' preferences for treatment.	During Construction	Applicant	City of Carson Department of Community Development, Building and Safety Division	City of Carson Department of Community Development, Building and Safety Division

Mitigation Measures	Monitoring Phase	Implementing Party	Enforcement Agency	Responsible Monitoring Agency
If the NAHC is unable to identify a MLD, or the MLD identified fails to make a recommendation, or the landowner rejects the recommendation of the MLD and the mediation provided for in Public Resources Code Section 5097.94, subdivision (k), if invoked, fails to provide measures acceptable to the landowner, the landowner or his or her authorized representative shall inter the human remains and items associated with Native American human remains with appropriate dignity on the facility property in a location not subject to further and future subsurface disturbance.				
MM-CULT-3. In the case of human remains findings (as mitigated under MM-CULT-2), should the remains be determined to be Native American and should the Kizh Nation be recommended by the NAHC as Most Likely Descendant (MLD), then the following policy shall apply. Should the Kizh Nation not be named MLD by the NAHC other procedures may be required by the assigned MLD. As the MLD, the Koo-nas-gna Burial Policy shall be implemented. To the Kizh Nation, the term "human remains" encompasses more than human bones. In ancient as well as historic times, Tribal Traditions included, but were not limited to, the preparation of the soil for burial, the burial of funerary objects with the deceased, and the ceremonial burning of human remains. If the discovery of human remains includes four or more burials, the discovery location shall be treated as a cemetery and a separate treatment plan shall be created. The prepared soil and cremation soils are to be treated in the same manner as bone fragments that remain intact. Associated funerary objects are objects that, as part of the death rite or ceremony of a culture, are reasonably believed to have been placed with individual human remains either at the time of death or later; other items made exclusively for burial purposes or to contain human remains can also be considered as associated funerary objects. Cremations will either be removed in bulk or by means as necessary to ensure complete recovery of all sacred materials. In the case where discovered human remains cannot be fully documented and recovered on the same day, the remains will be covered with muslin cloth and a steel plate that can be moved by heavy equipment placed over the excavation opening to protect the remains. If this type of steel plate is not available, a 24-hour guard should be posted outside of working hours. The Kizh Nation will make every effort to recommend diverting the project and keeping the remains in situ and protected. If the project cannot be diverted, it may be determined that burials will be removed. In the event preservation in place is not possible despite good faith efforts by the project	During Construction	Applicant	City of Carson Department of Community Development, Building and Safety Division	City of Carson Department of Community Development, Building and Safety Division

Mitigation Measures	Monitoring Phase	Implementing Party	Enforcement Agency	Responsible Monitoring Agency
applicant/developer and/or landowner, before ground-disturbing activities may resume on the project site, the landowner shall arrange a designated site location within the footprint of the project for the respectful reburial of the human remains and/or ceremonial objects. Each occurrence of human remains and associated funerary objects will be stored using opaque cloth bags. All human remains, funerary objects, sacred objects and objects of cultural patrimony will be removed to a secure container on-site if possible. These items should be retained and reburied within 6 months of recovery. The site of reburial/repatriation shall be on the project site but at a location agreed upon between the Kizh Nation and the landowner at a site to be protected in perpetuity. There shall be no publicity regarding any cultural materials recovered. The Kizh Nation will work closely with the project's qualified archaeologist to ensure that the excavation is treated carefully, ethically and respectfully. If data recovery is approved by the Kizh Nation, documentation shall be prepared and shall include (at a minimum) detailed descriptive notes and sketches. All data recovery data recovery-related forms of documentation shall be approved in advance by the Kizh Nation. If any data recovery is performed, once complete, a final report shall be submitted to the Kizh Nation and the NAHC. The Kizh Nation does NOT authorize any scientific study or the utilization of any invasive and/or destructive diagnostics on human remains.				
Noise				
MM-NOI-1. Temporary construction noise barriers, with a minimum rating of Sound Transmission Class (STC) 30 and Noise Reduction Coefficient (NRC) 0.7, shall be implemented prior to grading/site preparation beginning on–site near the northern and northeastern project boundaries (R1, R2, and R3) as follows: • Along the northern project boundary: A noise barrier with a minimum height of 15 feet above grade. • Beginning at the northeast corner of the subject site and continuing south along the eastern project boundary to 15 feet beyond the southern edge of the multi-family complex located at 21610 S. Perry Street: A noise barrier with a minimum height of 18 feet above grade.	Pre-Construction	Applicant	City of Carson Department of Community Development, Planning Division	City of Carson Department of Community Development, Building and Safety Division
MM-NOI-2. No more than two pieces of the following specific off-road construction equipment shall be used at the same time within 50 feet the north and north-eastern boundary of the project site. Such equipment includes the following: • Concrete Saws	During Construction	Applicant	City of Carson Department of Community	City of Carson Department of Community

Mitigation Measures	Monitoring Phase	Implementing Party	Enforcement Agency	Responsible Monitoring Agency
• Pavers • Paving Equipment • Generators • Pumps These pieces of equipment have the highest reference noise level as indicated by the Federal Highway Administration's Roadway Construction Noise Model User's Guide. By limiting the number of noisy equipment operating at the same time within 50 feet of the north and north-eastern boundary of the project site, the cumulative noise effect from multiple equipment will be reduced.			Development, Planning Division	Development, Building and Safety Division
Tribal Cultural Resources				
MM-TCR-1: Retain a Native American Monitor Prior to Commencement of Ground-Disturbing Activities. A. The project applicant/lead agency shall retain a Native American Monitor from or approved by the Gabrieleño Band of Mission Indians – Kizh Nation. The monitor shall be retained prior to the commencement of any "ground-disturbing activity" for the subject project at all project locations (i.e., both on-site and any off-site locations that are included in the project description/definition and/or required in connection with the project, such as public improvement work) outside or below the previous remediation areas. "Ground disturbing activity" shall include, but is not limited to, demolition, pavement removal, potholing, auguring, grubbing, tree removal, boring, grading, excavation, drilling, and trenching. B. A copy of the executed monitoring agreement shall be submitted to the lead agency prior to the commencement of any ground-disturbing activity, or the issuance of any permit necessary to commence a ground-disturbing activity. C. The monitor will complete daily monitoring logs that will provide descriptions of the relevant ground-disturbing activities, the type of construction activities performed, locations of ground disturbing activities, soil types, cultural-related materials, and any other facts, conditions, materials, or discoveries of significance to the Tribe. Monitor logs will identify and describe any discovered tribal cultural resources (TCRs), including but not limited to, Native American cultural and historical artifacts, remains, places of significance, etc., (collectively, tribal cultural resources, or "TCR"), as well	Prior to issuance of a demolition permit/Pre-Construction	Applicant	City of Carson Department of Community Development, Building and Safety Division	City of Carson Department of Community Development, Building and Safety Division

Mitigation Measures	Monitoring Phase	Implementing Party	Enforcement Agency	Responsible Monitoring Agency
as any discovered Native American (ancestral) human remains and burial goods. Copies of the monitor logs will be provided to the project applicant/lead agency. D. On-site tribal monitoring shall conclude upon the latter of the following (1) written confirmation to the Kizh Nation from a designated point of contact for the project applicant/lead agency that all ground-disturbing activities and phases that may involve ground-disturbing activities on the project site or in connection with the project are complete; or (2) a determination and written notification by the Kizh Nation to the project applicant/lead agency that no future, planned construction activity and/or development/construction phase at the project site possesses the potential to impact Kizh Nation TCRs. E. Upon discovery of any TCRs, all construction activities in the immediate vicinity of the discovery shall cease (i.e., not less than the surrounding 50 feet) and shall not resume until the discovered TCR has been fully assessed by the Kizh Nation monitor. A meeting shall take place between the Applicant, the qualified Archaeologist, the Kizh Nation, and the City to discuss the significance of the find and whether it qualifies as a tribal cultural resource pursuant to Public Resources Code Section 21074(a) and appropriate treatment under CEQA. The Project Archaeologist shall provide a treatment plan as recommended in Mitigation Measure CUL-MM-1, that shall incorporate the monitoring Kizh Nation's treatment and curation recommendations. The preferred treatment under CEQA is avoidance, but if not feasible, may include, but would not be limited to, capping in place, excavation and removal of the resource and follow-up laboratory processing and analysis, interpretive displays, sensitive area signage, or other mutually agreed upon measures. The Kizh Nation will recover and retain all discovered TCRs in the form and/or manner the Kizh Nation deems appropriate, at the Kizh Nation's sole discretion, and for any purpose the Kizh Nation deems appropriate, including for educational, cultural, and/or historic purposes.

Road Dust

Paved Road Dust Emission Factors (Assumes No Precipitation)

Formula: $EF_{Dust,P} = (k\ (sL)^{0.91} \times (W)^{1.02})$

Where:

$EF_{Dust,P}$ =	Paved Road Dust Emission Factor (having the same units as k)
k =	particle size multiplier
sL =	road surface silt loading (g/m^2)
W =	average fleet vehicle weight (tons) (CARB uses 2.4 tons as a fleet average vehicle weight factor)

Emission Factor (grams per VMT)			
	PM10	PM2.5	
k	1.0000	0.1500	
sL	0.0200	0.0200	weighted average silt loading factor used
W	2.4	2.4	
P	46	46	Table 5 of CARB Miscellaneous Process Methodology 7.9 for Los Angeles County
N	365	365	
$EF_{Dust,P}$	0.0672	0.0101	← use in off-model calculation as EF

Silt Loading Factor

Source: CARB, 2021.

Table 3: California Default Statewide and Local Silt Loading Values (Los Angeles County)

Silt Loadings (g/m2)			
Freeway	**Major**	**Collector**	**Local**
0.015	0.013	0.013	0.135

Table 2: Roadway Travel Fractions (Los Angeles County)

2008 HPMS Travel Fractions			
0.44	0.44	0.07	0.05

Unpaved Road Dust Emission Factors (Assumes No Precipitation)

Formula: $EF_{Dust,U} = (k\ (\ s / 12)^{1} \times (Sp / 30)^{0.5} / (M / 0.5)^{0.2}) - C)$

Where:

$EF_{Dust,U}$ =	Unpaved Road Dust Emission Factor (having the same units as k)
k =	particle size multiplier
s =	surface material silt content (%)
Sp =	mean vehicle speed (mph)
M =	surface material moisture content (%)
C =	Emission Factor for 1980s vehicle fleet exhaust, brake wear, and tire wear

Emission Factor (grams per VMT)		
	PM10	PM2.5
k	816.47	81.65
s	4.3%	4.3%
Sp	15	15
M	0.5%	0.5%
C	0.00047	0.00036
$EF_{Dust,U}$	5.20E+00	5.19E-01

Subject: Biological Literature and Database Review Results for the 21611 Perry Street Self Storage Project

Dear Ms. Edmondson:

This letter report documents the results of a California Natural Diversity Database (CNDDB) and California Native Plant Society's (CNPS) Online Inventory of Rare and Endangered Plants records search reviewed for 21611 Perry Street Self Storage Project, located in the City of Carson, Los Angeles County, California.

Project Site Location

The 21611 Perry Street Self Storage Project is located on a 2.80-acre lot at 21611 South Perry Street in the City of Carson (Project Site). The Project Site is within the Torrance U.S. Geological Survey (USGS) 7.5-minute topographic quadrangle map. The project proposes the development of a self-storage facility with three buildings totaling approximately 113,714 square feet. Additionally, the proposed project would provide approximately 23,000 square feet of landscaping around the perimeter of the project site. The property was previously developed with an industrial building and paved parking surfaces through 2011.

Methods

A review of aerial maps and biological resource databases was undertaken to identify biological resources potentially occurring within the Project Site and broader vicinity of the immediately adjacent region. Recent and historical aerial imagery was reviewed, as well as the topographic electronic copies of the Torrance USGS 7.5-minute topographic quadrangle map. Aerial imagery (Google Earth 2021) was reviewed to confirm the current locations of developed and undeveloped land, and unique landforms within the Project Site vicnity. A list of special-status plant and wildlife species and their habitats previously recorded to occur near the Project Site was compiled primarily from the California Department of Fish and Wildlife (CDFW), California Natural Diversity Database (CNDDB) (2021) and California Native Plant Society (CNPS) (2021) Inventory of Rare and Endangered Plants. ESA conducted a query of the CNDDB and CNPS records for the following USGS 7.5-minute topographic quadrangle maps that surround the Project Site included: Inglewood, Long Beach, Redondo Beach, San Pedro, South Gate, Torrance, and Venice. Based on Google Earth imagery, the Project Site consists of sparse ruderal vegetation with plantings of carrotwood (*Cupaniopsis anacardioides*) as street trees along Perry Street.

Other data sources reviewed included the United States Department of Agriculture Natural Resources Conservation Service (NRCS) soils mapping (USDA 2021), U.S. Fish and Wildlife Service (USFWS) critical habitat maps (USFWS 2021a), the USFWS Information for Planning and Consultation (IPaC) (USFWS 2021b), and the National Wetlands Inventory (NWI) (USFWS 2021c).

Results

Special-Status Species and Sensitive Communities/Habitats

Special-status plants are defined as those plants that, because of their recognized rarity or vulnerability to various causes of habitat loss or population decline, are recognized by federal, state, or other agencies as under threat from human-associated developments. Some of these species receive specific protection that is defined by federal or state endangered species legislation. Others have been designated as special-status on the basis of adopted policies and expertise of state resource agencies or organizations with acknowledged expertise, or policies adopted by local governmental agencies such as counties, cities, and special districts to meet local conservation objectives. Special-status plants are defined as follows:

- Plants that are listed or proposed for listing as threatened or endangered, or are candidates for possible future listing as threatened or endangered, under the FESA or the CESA
- Plants that meet the definitions of rare or endangered under State CEQA Guidelines Section 15380
- Plants covered under an adopted Natural Community Conservation Plan (NCCP)/Habitat Conservation Plan (HCP)
- Plants considered by the CNPS to be rare, threatened, or endangered (Rank 1A, 1B, 2A and 2B plants) in California
- Plants listed as rare under the California Native Plant Protection Act (Fish and Game Code 1900 et seq.)

The potential for special-status plant species to occur within the Project Site is based on on-site vegetation and habitat quality, topography, elevation, soils, surrounding land uses, habitat preferences and geographic ranges. A review of the CNDDB (CDFW 2021) and the CNPS Inventory of Rare and Endangered Plants (CNPS 2021) revealed that many special-status plant species have been recorded within the USGS quadrangle search area.

A total of 15 special-status plant species were determined to have no to low potential to occur within the Project Site. No focused rare plant surveys were conducted at this time nor are they warranted. Additionally, no sensitive natural communities occur within the Project Site or adjacent vicinity. However, based on the criteria listed below, it has been determined that two of these special-status plant species have a low potential to occur because of the sites proximity to the Dominguez Channel to the west. These two species with low potential to occur are southern tarplant (*Centromadia parryi* ssp. *australis*) and Coulter's goldfields (*Lasthenia glabrata* ssp. *coulteri*). All results and potential to occur determinations are listed in Attachment A.

The criteria for potential to occur include:

- **Present:** Species was observed or detected during the biological survey.
- **High Potential:** Species identified in the literature search and/or known to occur in the region and suitable habitat is present on the project site. These species are generally common and/or widespread in the project area and vicinity.

- **Moderate Potential:** Species identified in the literature search and/or known to occur in the region and suitable habitat is present within the project site. These species are generally less common and/or widespread than species considered to have "high" potential to occur.
- **Low Potential:** Species identified in the literature search or known to occur in the region, but the habitat on site is of low or marginal quality and/or the project site occurs outside the species known geographic or elevational range. Distance to nearest known occurrence and the age of last reported local occurrence are also considered.
- **Not Expected:** Species identified in the literature search or known to occur in the region, but suitable habitat on site is not present, nor is such habitat nearby. Distance to nearest known occurrence and the age of last reported local occurrence are also considered.

Two special-status plant species are determined to have a low potential to occur within the Project Site. The 13 species with no potential to occur within the project site are further detailed in **Attachment A**.

Special-Status Wildlife

Special-status wildlife consists of those animals that, because of their recognized rarity or vulnerability to various forms of habitat loss or population decline, are considered by federal, state, or other agencies to be under threat from human-associated developments. Some of these species receive specific protection that is defined by federal or state endangered species legislation and others have been designated as special-status on the basis of adopted local policies (i.e., city and county) or the educated opinion of respected resource interest groups (e.g., Western Bat Working Group). Special-status wildlife is defined as follows:

- Wildlife listed or proposed for listing as threatened or endangered, or are candidates for possible future listing as threatened or endangered, under the FESA or the CESA.
- Wildlife that meet the definitions of rare or endangered under California Environmental Quality Act (CEQA) Guidelines Section 15380.
- Wildlife covered under an adopted NCCP/HCP.
- Wildlife designated by CDFW as species of special concern, included on the Watch List or are considered Special Animals.
- Wildlife "fully protected" in California (California Fish and Game [CFG] Code Sections 3511, 4700, and 5050).
- Bird species protected by the Migratory Bird Treaty Act (MBTA).
- Bat species considered priority by the Western Bat Working Group (WBWG).

The potential for special-status wildlife species to occur within the Project Site is based on on-site vegetation and habitat quality, topography, elevation, soils, surrounding land uses, habitat preferences and geographic ranges. A review of the CNDDB (CDFW 2021) revealed that many special-status wildlife species have been recorded within the seven USGS quadrangle search area. This analysis included 18 special-status wildlife species. However, based on the criteria listed below, it has been determined that none of these wildlife species have the potential to occur because they lacked the necessary habitat requirements or do not have a range that overlaps within the Project Site. These are further detailed in **Attachment B** and have been omitted from further discussion.

- **Present:** The species was observed within the Project Site during the site assessment or has been documented within or immediately adjacent to the Project Site during recent surveys (with 2 years).
- **High Potential:** Species identified in the literature search and/or known to occur in the region and suitable habitat is present on the Project Site. These species are generally common and/or widespread in the Project Site area and vicinity.
- **Moderate Potential:** Species identified in the literature search and/or known to occur in the region and suitable habitat is present within the Project Site. These species are generally less common and/or widespread than species considered to have "high" potential to occur.
- **Low Potential:** Species identified in the literature search or known to occur in the region, but the habitat on site is of low or marginal quality and/or the Project Site occurs outside the species known geographic or elevational range. Distance to nearest known occurrence and the age of last reported local occurrence are also considered.
- **Not Expected:** Species identified in the literature search or known to occur in the region, but suitable habitat on site is not present, nor is such habitat nearby. Distance to nearest known occurrence and the age of last reported local occurrence are also considered.

A total of 18 special-status wildlife species were determined as not expected to occur within the Project Site. No focused surveys were conducted at this time and none are warranted. All results and potential to occur determinations are listed in Attachment B. All species identified through the database search are not expected to occur in the Project Site due to the history of the developed nature of the site and near complete lack of suitable habitat.

Conclusion

No site visits were conducted during this biological literature and database review. In summary, only two special-status plant species were determined to have a low potential to occur within the Project Site. No other special-status plant or wildlife species are not expected to occur within the Project Site. Additionally, no sensitive natural communities occur within the Project Site or adjacent vicinity. It should be stated the Project Site was previously completely developed and built up with a large building and associated infrastructure therefore has limited vegetation and wildlife species.

Should you have any questions regarding the findings in this letter report, please do not hesitate to contact Ryan Gilmore (rgilmore@esassoc.com) at 909-727-7634.

Attachment A: Special-Status Plant Species

SPECIAL-STATUS PLANT SPECIES – NOT EXPECTED TO LOW POTENTIAL TO OCCUR WITHIN THE PROJECT SITE

Common Name *Scientific Name*	Flowering Period	Sensitivity Status	Preferred Habitat/Known Elevational Range	Presence/Potential to Occur within Project Site
Dicots				
aphanisma *Aphanisma blitoides*	February - June	--/--/1B.2	Coastal bluff scrub, coastal dunes, and coastal scrub sometimes in gravelly or sandy soils. Typically, on bluffs and slopes near the ocean. Elevation range: 5 – 1,000 feet (CNDDB 2021; CNPS 2021).	**Not expected.** No suitable habitat within the BSA. Single CNDDB record exists over seven miles west of BSA with an unspecified date (CNDDB 2021).
Coulter's saltbush *Atriplex coulteri*	March - October	--/--/1B.2	Coastal bluff scrub, coastal dunes, coastal scrub, and valley and foothill grassland sometimes in alkaline or clay soils. Ocean bluffs, ridgetops, as well as alkaline low places. Elevation range: 10 – 1,510 feet (CNDDB 2021; CNPS 2021).	**Not expected.** No suitable habitat within the BSA. Both CNDDB records within five miles of BSA classified as extirpated (CNDDB 2021).
south coast saltscale *Atriplex pacifica*	March – October	--/--/1B.2	Coastal bluff scrub, coastal dunes, coastal scrub, and playas in alkali soils. Elevation range: 0 –460 feet (CNDDB 2021; CNPS 2021).	**Not expected.** No suitable habitat within the BSA. Single CNDDB record from 1903 exists over seven miles west of BSA (CNDDB 2021).
Parish's brittlescale *Atriplex parishii*	June - October	--/--/1B.1	Alkali meadows, vernal pools, chenopod scrub, and playas. Typically located on alkali flats with finely textured soils. Elevation range: 13 – 6,160 feet (CNDDB 2021; CNPS 2021).	**Not expected.** No suitable habitat within the BSA. Single CNDDB record exists over seven miles west of BSA with an unspecified date (CNDDB 2021).
Davidson's saltscale *Atriplex serenana* var. *davidsonii*	April - October	--/--/1B.2	Coastal bluff scrub and coastal scrub. Located on alkaline soils. Elevation range: 0 – 650 feet (CNDDB 2021; CNPS 2021).	**Not expected.** No suitable habitat within the BSA. Single CNDDB record dated 1906 exists six miles south of BSA and classified as possibly extirpated (CNDDB 2021).
southern tarplant *Centromadia parryi* ssp. *australis*	May – November	--/S2/1B.1	Margins of marshes and swamps, and valley and foothill grassland. Often located on disturbed sites near the coast at marsh edges in alkaline soils. Sometimes along vernal pool margins. Elevation range: 0–1,385 feet. (CNDDB 2021; CNPS 2021).	**Low Potential.** This species has a low potential to occur due to presence of marginally suitable habitat and occurrences less than one mile upstream of BSA (CNDDB 2021). This species has a low potential to occur along the Dominguez Channel that is adjacent to the BSA, but only where damp grassland habitat might occur.
smooth tarplant *Centromadia pungens ssp. laevis*	April - September	--/--/1B.1	Chenopod scrub, meadows and seeps, playas, riparian woodland, and valley and foothill grassland in alkaline soils. Also in disturbed places. Elevation range: 0 – 2,100 feet (CNDDB 2021; CNPS 2021).	**Not expected.** No suitable habitat within the BSA. Single CNDDB record dated 1920 exists approximately six miles south of BSA and classified as possibly extirpated (CNDDB 2021).
salt marsh bird's-beak *Chloropyron maritimum ssp. maritimum*	May – October (November)	FE/SE/1B.2	Coastal dunes and marshes and swamps. Limited to higher zones of salt marsh habitat. Elevation range: 0 – 100 feet (CNDDB 2021; CNPS 2021).	**Not expected.** No suitable habitat within the BSA. Single CNDDB record dated 1980 exists approximately six miles south of BSA and classified as possibly extirpated (CNDDB 2021).
decumbent goldenbush *Isocoma menziesii var. decumbens*	April - November	--/--/1B.2	Chaparral and coastal scrub in sandy soils. Often on disturbed sites. Elevation range: 3 – 915 feet (CNDDB 2021; CNPS 2021).	**Not expected.** No suitable habitat within the BSA. Single CNDDB record dated 1897 exists five miles south of BSA and classified as extirpated (CNDDB 2021).

Common Name ***Scientific Name***	**Flowering Period**	**Sensitivity Status**	**Preferred Habitat/Known Elevational Range**	**Presence/Potential to Occur within Project Site**
Coulter's goldfields *Lasthenia glabrata ssp. coulteri*	February - June	--/--/1B.1	Marshes and swamps, playas, and vernal pools. Usually found on alkaline soils in playas, sinks, and grassland. Elevation range: 5 – 4,005 feet (CNDDB 2021; CNPS 2021).	**Low Potential.** This species has a low potential to occur due to marginally suitable habitat. Two occurrences within one mile northwest of BSA: one from 1917 classified as possibly extirpated and one from 1962 classified as extant (CNDDB 2021).
mud nama *Nama stenocarpa*	January - July	--/--/2B.2	Marshes and swamps. Also along lake shores, river banks, and intermittently wet areas. Elevation range: 15 – 1,640 feet (CNDDB 2021; CNPS 2021).	**Not expected.** No suitable habitat within the BSA. Single CNDDB record dated 1924 exists within five miles south of BSA (CNDDB 2021).
prostrate navarretia *Navarretia prostrata*	April - July	--/--/1B.1	Found in mesic conditions within coastal scrub, meadows and seeps, valley and foothill grassland (alkaline), and vernal pools. Elevation range: 10 – 2270 feet (CNDDB 2021; CNPS 2021).	**Not expected.** No suitable habitat within the BSA. Most recent CNDDB record dated 1882 classified as possibly extirpated and located over 2 miles south of BSA (CNDDB 2021).
Brand's star phacelia *Phacelia stellaris*	March – June	--/--/1B.1	Coastal dunes and coastal scrub in open areas. Elevation range: 5 – 1,310 feet (CNDDB 2021; CNPS 2021).	**Not expected.** No suitable habitat within the BSA. Most recent CNDDB record dated 1897 located over six miles west of BSA (CNDDB 2021).
estuary seablite *Suaeda esteroa*	(January - May) July - October	--/--/1B.2	Marshes and swamp and coastal salt marshes in clay, silt, and sand substrates. Elevation range: 0 – 15 feet (CNDDB 2021; CNPS 2021).	**Not expected.** No suitable habitat within the BSA. Most recent CNDDB record dated 1904 located over six miles south of BSA (CNDDB 2021).
San Bernardino aster *Symphyotrichum defoliatum*	July - November	--/--/1B.2	Meadows and seeps, marshes and swamps, coastal scrub, cismontane woodland, lower montane coniferous forest, and grassland. Located in mesic grassland near ditches, streams, and springs. Also found on disturbed sites. Elevation range: 5 – 6,630 feet (CNDDB 2021; CNPS 2021).	**Not Expected.** No suitable habitat within the BSA. Occurrences less than one mile upstream of BSA; however, occurrence is classified as extirpated (CNDDB 2021).

Attachment B: Special-Status Wildlife Species

SPECIAL-STATUS WILDLIFE SPECIES – NOT EXPECTED TO OCCUR WITHIN THE PROJECT SITE

Common Name *Scientific Name*	Sensitivity Status	Preferred Habitat/Known Elevational Range	Presence/Potential to Occur within the Project Site
Invertebrates			
Crotch bumble bee *Bombus crotchii*	--/SSC/S1S2	Open grassland and scrub habitats that support potential nectar sources such as plants within the Fabaceae, Apocynaceae, Asteraceae, Lamiaceae, and Boraginaceae families.	**Not Expected.** Limited to no suitable habitat present within the BSA. CNDDB occurrences are over five miles away from BSA with the most recent 2017 record being located at White Point Nature Preserve over 8 miles southwest of the BSA (CNDDB 2021).
sandy beach tiger beetle *Cicindela hirticollis gravida*	--/--/S2	Inhabits areas adjacent to non-brackish water along the coast of California from San Francisco Bay to northern Mexico.	**Not Expected.** No suitable habitat present within the BSA. There are multiple CNDDB records dated from 1907-1979 all classified as extirpated (CNDDB 2021).
western beach tiger beetle *Cicindela latesignata latesignata*	--/--/S1	Coastal habitats, primarily beaches.	**Not Expected.** No suitable habitat present within the BSA. There are two CNDDB records dated from 1979 classified as extirpated (CNDDB 2021).
monarch - California overwintering population *Danaus plexippus* pop. 1	FC/--/S2S3	Wintering sites in California are associated with wind-protected groves of large trees (primarily eucalyptus or pine [*Pinus* spp.]) with nectar and water sources nearby that are generally near the coast.	**Not Expected.** No suitable habitat present within the BSA. The closest CNDDB occurrence is from 2014 and located approximately three miles south of the BSA (CNDDB 2021).
Palos Verdes blue butterfly *Glaucopsyche lygdamus palosverdesensis*	FE/--/S1	Restricted to coastal scrub on the seaward side of Palos Verdes Hills in Los Angeles County. Host species include *Acmispon glaber* and *Astragalus trichopodus* var. *lonchus*.	**Not Expected.** No suitable habitat present within the BSA. In 2001, the entire Torrance quad map was designated as a CNDDB occurrence (CNDDB 2021).
San Gabriel chestnut *Glyptostoma gabrielense*	--/--/S2	Terrestrial habitat in humid areas under rocks, logs, and cactus near a body of water (CNDDB 2021).	**Not Expected.** No suitable habitat present within the BSA. There are two CNDDB records from the 1900s classified as possibly extirpated. The closest occurrence is located just over one mile to the northeast of the BSA (CNDDB 2021).
western tidal-flat tiger beetle *Habroscelimorpha gabbii*	--/--/S1	Inhabits estuaries and mudflats along the coast of Southern California. Generally found on dark-colored mud in the lower zone; occasionally found on dry saline flats of estuaries (CNDDB 2021).	**Not Expected.** No suitable habitat present within the BSA. There are two dateless CNDDB records classified as extirpated and possibly extirpated (CNDDB 2021).
Riverside fairy shrimp *Streptocephalus woottoni*	FE/--/--	Endemic to western Riverside, Orange and San Diego Counties in areas of tectonic swales/earth slump basins in grassland and coastal sage scrub. Inhabit seasonally astatic pools filled by winter/spring rains greater than 12 inches in depth. Hatch in warm water later in the season. Typically observed January through March.	**Not Expected.** No suitable habitat present within the BSA. The closest CNDDB record from 2010 is located approximately five miles west of the BSA. Two additional CNDDB records over 10 miles northwest of the BSA are classified as extirpated (CNDDB 2021).
mimic tryonia (=California brackishwater snail) *Tryonia imitator*	--/--/S2	Inhabits coastal lagoons, estuaries and salt marshes, from Sonoma County south to San Diego County.	**Not Expected.** No suitable habitat present within the BSA. The closest CNDDB record from 2007 is located approximately six miles south of the BSA. Two additional CNDDB records are classified as extirpated and possibly extirpated (CNDDB 2021).

Common Name *Scientific Name*	Sensitivity Status	Preferred Habitat/Known Elevational Range	Presence/Potential to Occur within the Project Site
Amphibians			
western spadefoot *Spea hammondii*	--/SSC/S3	Mixed woodland, grasslands, chaparral, sandy washes, lowlands, river floodplains, alluvial fans, playas, alkali flats, foothills, and mountains. Prefers washes and other sandy areas with patches of brush and rocks. Rain pools or shallow temporary pools, which do not contain bullfrogs, fish, or crayfish are necessary for breeding. Perennial plants necessary for its major food-termites.	**Not Expected.** No suitable habitat present within the BSA. There are multiple CNDDB records dated from 1938-1966 all classified as possibly extirpated. The closest occurrence is undated, located approximately two miles southwest of the BSA, and is classified as extirpated (CNDDB 2021).
Reptiles			
Southern California legless lizard *Anniella stebbinsi*	--/SSC/S3	Found in broadleaved upland forest, chaparral, coastal dunes, and coastal scrub habitats, and generally found under sparse vegetation in sandy or loose loamy soils with a high moisture content.	**Not Expected.** No suitable habitat present within the BSA. There are multiple CNDDB records within five miles of the BSA. The closest occurrences are approximately 4 miles southwest of the BSA and are dated 1968 and 2009 (CNDDB 2021).
coast horned lizard *Phrynosoma blainvillii*	--/SSC/S3S4	Prefers sandy sage scrub habitats but also occurs in valley-foothill hardwood, conifer, pine-cypress, juniper and annual grassland habitats below 6,000 feet, open country, especially sandy areas, washes, flood plains, and windblown deposits. Requires open areas for sunning, bushes and loose soil for cover and abundant supply of harvester ants.	**Not Expected**. Limited suitable habitat located within the BSA. The most recent CNDDB record is from 1952 within five miles of BSA and is classified as possibly extirpated (CNDDB 2021).
Birds			
tricolored blackbird *Agelaius tricolor*	--/ST, SSC/S1S2	Known to occur in freshwater marsh, marsh, swap, and wetland. Highly colonial species, most numerous in Central Valley and vicinity. Requires open water, protected nesting substrate, and foraging area with insect prey within a few kilometers of the colony.	**Not Expected**. No suitable habitat located within the BSA. The most recent CNDDB records are from the 1980s and are within five miles of BSA (CNDDB 2021).
western yellow-billed cuckoo *Coccyzus americanus occidentalis*	FT, BCC/SE/S1	Riparian forest nester, along the broad, lower flood-bottoms of larger river systems. Nests in riparian jungles of willow, often mixed with cottonwoods, with lower story of blackberry nettles, or wild grape.	**Not Expected.** No suitable habitat present within the BSA. There are four CNDDB records within five miles of the BSA all classified as extirpated (CNDDB 2021).
coastal California gnatcatcher *Polioptila californica californica*	FT/SSC/S2	Species is an obligate, permanent resident of coastal sage scrub habitats dominated by California sagebrush and flat-topped buckwheat, mainly on cismontane slopes below 1,500 feet in elevation. Low coastal sage scrub in arid washes, on mesas and slopes.	**Not Expected.** No suitable habitat located within the BSA. There are multiple CNDDB records over five miles southwest of the BSA along the coast (CNDDB 2021).
California least tern *Sternula antillarum browni*	FE/SE/S2	Known to occur in alkali playas and coastal dune and beach habitats. Nests along the coast from San Francisco Bay south to northern Baja California. Colonial breeder on bare or sparsely vegetated, flat substrates: sand beaches, alkali flats, landfills, or paved areas.	**Not Expected.** Limited suitable habitat located within the BSA. There is a single CNDDB record within five miles of the BSA from 1977 (CNDDB 2021).

Common Name *Scientific Name*	Sensitivity Status	Preferred Habitat/Known Elevational Range	Presence/Potential to Occur within the Project Site
Mammals			
pocketed free-tailed bat *Nyctinomops femorosaccus*	--/SSC/S3	Inhabits pinyon-juniper woodlands, riparian scrub, Sonoran desert scrub, desert succulent shrub, desert riparian, desert wash, alkali desert scrub, Joshua tree woodland, and palm oasis. Typically roosts in caves and rocky outcrops; prefers cliffs in order to obtain flight speed. Feeds on insects flying over bodies of water or arid desert habitats to capture prey.	**Not Expected.** No suitable habitat located within the BSA. The closest CNDDB record is within five miles southwest of the BSA and was recorded in 1985 (CNDDB 2021).
Pacific pocket mouse *Perognathus longimembris pacificus*	FE/SSC/S1	Found in the coastal scrub and maritime chaparral from the Mexican border north to El Segundo, Los Angeles County. Commonly associated with gravelly, or fine alluvial soils within coastal plains in the immediate vicinity of the Pacific Ocean. Also found on coastal strand, coastal dunes, and ruderal vegetation on river alluvium, within open, sparsely vegetated areas.	**Not Expected**. No suitable habitat located within the BSA. The most recent CNDDB record is from 1985 within five miles of BSA and is classified as extirpated (CNDDB 2021).

Attention: Mr. Darren Embry

Subject: GEOTECHNICAL INVESTIGATION
PROPOSED COMMERCIAL DEVELOPMENT
21611 SOUTH PERRY STREET
CARSON, CALIFORNIA
APN: 7327-010-014

Dear Mr. Embry:

In accordance with your authorization of our proposal dated December 11, 2020, we have prepared this geotechnical investigation report for the proposed commercial development located at 21611 South Perry Street in the City of Carson, California. The accompanying report presents the findings of our study, and our conclusions and recommendations pertaining to the geotechnical aspects of proposed design and construction. Based on the results of our investigation, it is our opinion that the site can be developed as proposed, provided the recommendations of this report are followed and implemented during design and construction.

If you have any questions regarding this report, or if we may be of further service, please contact the undersigned.

Very truly yours,

GEOCON WEST, INC.

GEOTECHNICAL INVESTIGATION

1. PURPOSE AND SCOPE

This report presents the results of a geotechnical investigation for the proposed commercial development located at 21611 South Perry Street in the City of Carson, California (see Vicinity Map, Figure 1). The purpose of the investigation was to evaluate subsurface soil and geologic conditions underlying the site and, based on conditions encountered, to provide conclusions and recommendations pertaining to the geotechnical aspects of design and construction.

The scope of this investigation included a review of prior environmental reports for the site provided by the client, a site reconnaissance, field exploration, laboratory testing, engineering analysis, and the preparation of this report. The site was explored on February 9, 2021 by drilling five 8-inch diameter borings using a truck-mounted hollow-stem auger drilling machine and advancing five cone penetrometer tests (CPTs). The borings were excavated to depths between approximately 20½ and 51 feet beneath the existing ground surface. The CPTs were advanced to depths of approximately 60 feet below existing ground surface. The approximate locations of the exploratory borings and CPTs are depicted on the Site Plan (see Figure 2). A detailed discussion of the field investigation, including the boring and CPT logs, is presented in Appendix A.

Laboratory tests were performed on selected soil samples obtained during the investigation to determine pertinent physical and chemical soil properties. Appendix B presents a summary of the laboratory test results.

The recommendations presented herein are based on analysis of the data obtained during the investigation and our experience with similar soil and geologic conditions. References reviewed to prepare this report are provided in the *List of References* section.

If project details vary significantly from those described herein, Geocon should be contacted to determine the necessity for review and possible revision of this report.

2. SITE AND PROJECT DESCRIPTION

The subject site is an approximately 2.6-acre irregularly shaped parcel located at 21611 South Perry Street in the City of Carson, California. The site is currently vacant. The site is bounded by South Perry Street on the east, by the Dominguez Channel to the west, by one- to two-story single-family homes to the north, and by East Carson Street to the south. The site is relatively level, with no pronounced highs or lows. Surface water drainage at the site appears to be by sheet flow along the existing ground contours to the city streets.

Based on the information provided by the Client, it is our understanding that the proposed development will consist of three 2-story self-storage structures. Based on preliminary plans it is anticipated that the development will be approximately 25 feet in height and will be constructed at or near present grade (see Figure 2).

Based on the preliminary nature of the design at this time, wall and column loads were not available. It is anticipated that column loads for the proposed structures will be up to 300 kips, and wall loads will be up to 3 kips per linear foot.

Once the design phase and foundation loading configuration proceeds to a more finalized plan, the recommendations within this report should be reviewed and revised, if necessary. Any changes in the design, location or elevation of any structure, as outlined in this report, should be reviewed by this office. Geocon should be contacted to determine the necessity for review and possible revision of this report.

3. BACKGROUND

Prior environmental reports were prepared for the site and provided for our review, and include the following:

Phase 1 Environmental Site Assessment, 21611 S. Perry Street, Carson, CA. 90745-1613, Prepared by Weis Environmental, dated January 25, 2021.

2020 First Semi-Annual Groundwater Monitoring Report, January Through June 2020, Dominguez Channel Release, Carson, California, Prepared by AECOM, dated July 14, 2020.

Based on the prior reports, petroleum hydrocarbon impacted soil and groundwater were previously identified at the site that originated from on-site underground storage tanks (USTs) and migration of contaminants from off-site sources. AECOM (formerly URS) developed a workplan that developed cleanup goals and excavation limits to remove impacted soils that was approved by the LARWQCB. In 2014, approximately 4,800 cubic yards of impacted soils were excavated from four areas and removed from the site. The excavations were approximately 5 to 8 feet deep and were backfilled with clean import soils (Weis Environmental, 2021). The approximate locations and depths of these areas are indicated on the Site Plan (see Figure 2). The backfill was reportedly placed, compacted, and tested as a certified backfill material; however, a copy of the compaction report was not included as an exhibit. Therefore, for the purposes of this report, the backfill is considered to be uncertified fill.

Also, as part of the prior site remediation, groundwater monitoring wells were installed at the site and the immediately surrounding area. The monitoring wells present at the site are limited to the eastern, western, and southern property boundaries. Groundwater monitoring is ongoing in these wells in compliance with a semi-annual groundwater monitoring program required by the LARWQCB.

Based on documents included in the referenced environmental reports, the known soil and groundwater impacts are within acceptable levels for commercial use and further assessment or remediation is not required. However, a soil management plan (SMP) is anticipated required for further development of the site. Development of a soil management plan is beyond the scope of the Geotechnical Investigation.

4. GEOLOGIC SETTING

The site is located in the southern portion of the Los Angeles Basin, a coastal plain bounded by the Santa Monica Mountains on the north, the Elysian Hills and Repetto Hills on the northeast, the Puente Hills and the Whittier Fault on the east, the Palos Verdes Peninsula and Pacific Ocean on the west and south, and the Santa Ana Mountains and San Joaquin Hills on the southeast. The basin is underlain by a deep structural depression which has been filled by both marine and continental sedimentary deposits underlain by a basement complex of igneous and metamorphic composition. Regionally, the site is located within the northern portion of the Peninsular Ranges geomorphic province. This geomorphic province is characterized by northwest-trending physiographic and geologic features such as the nearby Newport-Inglewood Fault Zone located approximately 2.7 miles to the east-northeast.

5. SOIL AND GEOLOGIC CONDITIONS

Based on our field investigation and published geologic maps of the area, the site is underlain by artificial fill and Holocene age alluvium consisting sand, silt, and clay (California Geological Survey, 2010). Detailed stratigraphic profiles of the materials encountered at the site are provided on the boring logs in Appendix A.

5.1 Artificial Fill

Artificial fill was encountered in our explorations to depths ranging from 3 to 9 feet below existing ground surface. The deep fill, observed in boring B3, is associated with an area of a former UST removal. The artificial generally consists of light brown to brown or grayish brown sand and silty sand. The artificial fill is characterized as fine-grained with some medium-grained, moist, and loose to dense. The fill is likely the result of past grading, UST removal and environmental remediation, and past construction activities at the site. Deeper fill may exist between excavations and in other portions of the site that were not directly explored.

5.2 Alluvium

Holocene age alluvium was encountered beneath the fill to the maximum depth explored (51 feet below the ground surface). The alluvium generally consists of light brown to brown, olive brown, or gray to dark gray interbedded clay, sandy clay, silt, sandy silt, silty sand and clayey sand. The alluvial soils are characterized as primarily fine-grained, moist to wet, and loose to dense or soft to stiff.

6. GROUNDWATER

A review of the Seismic Hazard Zone Report for the Torrance Quadrangle (California Division of Mines and Geology [CDMG], 1998) indicates the historically highest groundwater level in the area is approximately 9 feet beneath the ground surface. Groundwater information presented in this document is generated from data collected in the early 1900's to the late 1990s. Based on current groundwater basin management practices, it is unlikely that groundwater levels will ever exceed the historic high levels.

Groundwater was encountered in borings B1 and B3 at depths of 12.5 feet and 17.6 feet beneath the existing ground surface, respectively. Additionally, readings from groundwater monitoring wells established on the site were taken on February 23, 2021. The locations of the accessible monitoring wells are indicated on the site plan (see Figure 2) and a summary of groundwater levels at the time of the investigation is provided in the table below.

Monitoring Well Readings

Well ID	MW-3	MW-4	MW-5	MW-7A	MW-8A	MW-9B
Depth to GW (Below Ground Surface)	12.0'	13.17'	12.25'	12.33'	12.67'	14.67'

Based on the depth to groundwater and the on-grade nature of the development, groundwater is not expected to have a detrimental effect on the project. Groundwater may be encountered during construction in deep drilled excavations, such as for ground improvement or elevator pistons. It is not uncommon for groundwater levels to vary seasonally or for groundwater seepage conditions to develop where none previously existed, especially in impermeable fine-grained soils which are heavily irrigated or after seasonal rainfall. In addition, recent requirements for stormwater infiltration could result in shallower seepage conditions in the immediate site vicinity. Proper surface drainage of irrigation and precipitation will be critical for future performance of the project. Recommendations for drainage are provided in the S*urface Drainage* section of this report (see Section 8.20).

7. GEOLOGIC HAZARDS

7.1 Surface Fault Rupture

The numerous faults in Southern California include Holocene-active, pre-Holocene, and inactive faults. The criteria for these major groups are based on criteria developed by the California Geological Survey (CGS, formerly known as CDMG) for the Alquist-Priolo Earthquake Fault Zone Program (CGS, 2018). By definition, a Holocene-active fault is one that has had surface displacement within Holocene time (about the last 11,700 years). A pre-Holocene fault has demonstrated surface displacement during Quaternary time (approximately the last 1.6 million years) but has had no known Holocene movement. Faults that have not moved in the last 1.6 million years are considered inactive.

The site is not within a state-designated Alquist-Priolo Earthquake Fault Zone for surface fault rupture hazards (CGS, 2021a; CGS, 2021b; CDMG 1986). No Holocene-active or pre-Holocene active faults with the potential for surface fault rupture are known to pass directly beneath the site. Therefore, the potential for surface rupture due to faulting occurring beneath the site during the design life of the proposed development is considered low. However, the site is located in the seismically active Southern California region, and could be subjected to moderate to strong ground shaking in the event of an earthquake on one of the many active Southern California faults. The faults in the vicinity of the site are shown in Figure 3, Regional Fault Map.

The closest surface trace of an active fault to the site is the Newport-Inglewood Fault Zone located approximately 2.7 miles to the east-northeast (USGS, 2006; CDMG, 1986). Other nearby active faults are the Palos Verdes Fault, the Cabrillo Fault, and the Whittier Fault located approximately 4.2 miles south-southwest, 8.2 miles south, and 16 miles northeast of the site, respectively. The active San Andreas Fault Zone is located approximately 48 miles northeast of the site.

Several buried thrust faults, commonly referred to as blind thrusts, underlie the Los Angeles Basin at depth. These faults are not exposed at the ground surface and are typically identified at depths greater than 3.0 kilometers. The October 1, 1987, M_w 5.9 Whittier Narrows earthquake and the January 17, 1994, M_w 6.7 Northridge earthquake were a result of movement on the Puente Hills Blind Thrust and the Northridge Thrust, respectively. These thrust faults and others in the Los Angeles area are not exposed at the surface and do not present a potential surface fault rupture hazard at the site; however, these deep thrust faults are considered active features capable of generating future earthquakes that could result in moderate to significant ground shaking at the site.

7.2 Seismicity

As with all of Southern California, the site has experienced historic earthquakes from various regional faults. The seismicity of the region surrounding the site was formulated based on research of an electronic database of earthquake data. The epicenters of recorded earthquakes with magnitudes equal to or greater than 5.0 in the site vicinity are depicted on Figure 4, Regional Seismicity Map. A partial list of moderate to major magnitude earthquakes that have occurred in the Southern California area within the last 100 years is included in the following table.

LIST OF HISTORIC EARTHQUAKES

Earthquake (Oldest to Youngest)	Date of Earthquake	Magnitude	Distance to Epicenter (Miles)	Direction to Epicenter
Near Redlands	July 23, 1923	6.3	59	E
Long Beach	March 10, 1933	6.4	22	SE
Tehachapi	July 21, 1952	7.5	91	NW
San Fernando	February 9, 1971	6.6	41	NNW
Whittier Narrows	October 1, 1987	5.9	19	NE
Sierra Madre	June 28, 1991	5.8	33	NE
Landers	June 28, 1992	7.3	107	ENE
Big Bear	June 28, 1992	6.4	85	ENE
Northridge	January 17, 1994	6.7	31	NW
Hector Mine	October 16, 1999	7.1	125	ENE
Ridgecrest	July 5, 2019	7.1	138	NNE

The site could be subjected to strong ground shaking in the event of an earthquake. However, this hazard is common in Southern California and the effects of ground shaking can be mitigated if the proposed structures are designed and constructed in conformance with current building codes and engineering practices.

7.3 Seismic Design Criteria

The following table summarizes the site-specific design criteria obtained from the 2019 California Building Code (CBC; Based on the 2018 International Building Code [IBC] and NEHRP-2015), Chapter 16 Structural Design, Section 1613, Earthquake Loads. The data was calculated using the online application *Seismic Design Maps*, provided by OSHPD. The short spectral response uses a period of 0.2 second. We evaluated the Site Class based on the discussion in Section 1613.2.2 of the 2019 CBC and Section 11.4.3 of NEHRP-2015. The values presented on the following page are for the risk-targeted maximum considered earthquake (MCE_R).

2019 CBC SEISMIC DESIGN PARAMETERS

Parameter	Value	2019 CBC Reference
Site Class	D	Section 1613.2.2
MCE_R Ground Motion Spectral Response Acceleration – Class B (short), S_S	1.711g	Figure 1613.2.1(1)
MCE_R Ground Motion Spectral Response Acceleration – Class B (1 sec), S_1	0.618g	Figure 1613.2.1(2)
Site Coefficient, F_A	1	Table 1613.2.3(1)
Site Coefficient, F_V	1.7*	Table 1613.2.3(2)
Site Class Modified MCE_R Spectral Response Acceleration (short), S_{MS}	1.711g	Section 1613.2.3 (Eqn 16-36)
Site Class Modified MCE_R Spectral Response Acceleration – (1 sec), S_{M1}	1.05g*	Section 1613.2.3 (Eqn 16-37)
5% Damped Design Spectral Response Acceleration (short), S_{DS}	1.141g	Section 1613.2.4 (Eqn 16-38)
5% Damped Design Spectral Response Acceleration (1 sec), S_{D1}	0.7g*	Section 1613.2.4 (Eqn 16-39)
Note: *Per Section 11.4.8 of ASCE/SEI 7-16, a ground motion hazard analysis shall be performed for projects for Site Class "E" sites with Ss greater than or equal to 1.0g and for Site Class "D" and "E" sites with S1 greater than 0.2g. Section 11.4.8 also provides exceptions which indicates that the ground motion hazard analysis may be waived provided the exceptions are followed. Using the code based values presented in the table above, in lieu of a performing a ground motion hazard analysis, requires the exceptions outlined in ASCE 7-16 Section 11.4.8 be followed.		

The table below presents the mapped maximum considered geometric mean (MCE_G) seismic design parameters for projects located in Seismic Design Categories of D through F in accordance with NEHRP-2015.

ASCE 7-16 PEAK GROUND ACCELERATION

Parameter	Value	ASCE 7-16 Reference
Mapped MCE_G Peak Ground Acceleration, PGA	0.748g	Figure 22-7
Site Coefficient, F_{PGA}	1.1	Table 11.8-1
Site Class Modified MCE_G Peak Ground Acceleration, PGA_M	0.823g	Section 11.8.3 (Eqn 11.8-1)

The Maximum Considered Earthquake Ground Motion (MCE) is the level of ground motion that has a 2 percent chance of exceedance in 50 years, with a statistical return period of 2,475 years. According to the 2019 California Building Code and ASCE 7-16, the MCE is to be utilized for the evaluation of liquefaction, lateral spreading, seismic settlements, and it is our understanding that the intent of the Building code is to maintain "Life Safety" during a MCE event. The Design Earthquake Ground Motion (DE) is the level of ground motion that has a 10 percent chance of exceedance in 50 years, with a statistical return period of 475 years.

Deaggregation of the MCE peak ground acceleration was performed using the USGS online Unified Hazard Tool, 2014 Conterminous U.S. Dynamic edition (v4.2.0). The result of the deaggregation analysis indicates that the predominant earthquake contributing to the MCE peak ground acceleration is characterized as a 6.87 magnitude event occurring at a hypocentral distance of 8.35 kilometers from the site.

Deaggregation was also performed for the Design Earthquake (DE) peak ground acceleration, and the result of the analysis indicates that the predominant earthquake contributing to the DE peak ground acceleration is characterized as a 6.68 magnitude occurring at a hypocentral distance of 13.48 kilometers from the site.

Conformance to the criteria in the above tables for seismic design does not constitute any kind of guarantee or assurance that significant structural damage or ground failure will not occur if a large earthquake occurs. The primary goal of seismic design is to protect life, not to avoid all damage, since such design may be economically prohibitive.

7.4 Liquefaction Potential

Liquefaction is a phenomenon in which loose, saturated, relatively cohesionless soil deposits lose shear strength during strong ground motions. Primary factors controlling liquefaction include intensity and duration of ground motion, gradation characteristics of the subsurface soils, in-situ stress conditions, and the depth to groundwater. Liquefaction is typified by a loss of shear strength in the liquefied layers due to rapid increases in pore water pressure generated by earthquake accelerations.

The current standard of practice, as outlined in the "Recommended Procedures for Implementation of DMG Special Publication 117, Guidelines for Analyzing and Mitigating Liquefaction in California" and "Special Publication 117A, Guidelines for Evaluating and Mitigating Seismic Hazards in California" requires liquefaction analysis to a depth of 50 feet below the lowest portion of the proposed structure. Liquefaction typically occurs in areas where the soils below the water table are composed of poorly consolidated, fine to medium-grained, primarily sandy soil. In addition to the requisite soil conditions, the ground acceleration and duration of the earthquake must also be of a sufficient level to induce liquefaction.

A review of the State of California Seismic Hazard Zone Map for the Torrance Quadrangle (CDMG, 1999) indicates that the site is located in an area designated as having a potential for liquefaction. Also, the City of Carson (2002) indicates the site is located within an area that has a potential for liquefaction.

The Standard Penetration Test (SPT) blow counts obtained from boring B3 were compared with the blow counts estimated from the CPT soundings. SPTs were performed in boring B3 at intervals of approximately 5 feet. In order to supplement the SPT blow count data, select California Modified Sampler blow count data were converted to equivalent SPT blow counts based on a correlation factor of 0.55 (Rogers, 2006). The field collected blow counts were corrected for hammer efficiency to N60 blow count values. The boring N60 values were compared with the N60 values generated by the program CpetIT (Version 3.2.1.7). The comparison of CPT-3 and boring B3 are shown as Figure 5. It is our opinion that the boring and CPT N60 values show a very reasonable correlation and that analysis of the liquefaction potential may be based on the CPT data.

Liquefaction analyses of the CPT soundings were performed using the program CLiq (Version 3.0.3.2). This program utilizes the 2001 NCEER method of analysis. This semi-empirical method is based on correlations with the data collected from the CPT soundings.

The liquefaction analysis was performed for a Design Earthquake level by using a historic groundwater level of 9 feet below the ground surface, a magnitude 6.68 earthquake, and a peak horizontal acceleration of 0.549g (⅔PGAM). The results of the enclosed liquefaction analyses included herein for CPTs 1 through 5 indicate that the alluvial soils below the design groundwater level could be susceptible to the liquefaction induced settlements summarized in the table below during Design Earthquake ground motion. A summary of the anticipated liquefaction induced settlements is provided as Figure 6; calculations and output from CLiq are provided as Appendix C.

Liquefaction Induced Settlements (Design Earthquake)

CPT Number	CPT-1	CPT-2	CPT-3	CPT-4	CPT-5
Liquefaction Settlement (in)	0.43	0.11	0.20	0.00	0.28

It is our understanding that the intent of the Building Code is to maintain "Life Safety" during Maximum Considered Earthquake level events. Therefore, additional analysis was performed to evaluate the potential for liquefaction during a MCE event. The structural engineer should evaluate the proposed structure for the anticipated MCE liquefaction induced settlements and verify that anticipated deformations would not cause the foundation system to lose the ability to support the gravity loads and/or cause collapse of the structure.

The liquefaction analysis performed for the Maximum Considered Earthquake level by using a historic groundwater level of 9 feet below the ground surface, a magnitude 6.87 earthquake, and a peak horizontal acceleration of 0.823g (PGAM). The results of the enclosed liquefaction analyses included herein for CPTs 1 through 5 indicate that the alluvial soils below the design groundwater level could be susceptible to the liquefaction induced settlements summarized in the table below during Maximum Considered Earthquake ground motion. A summary of the anticipated liquefaction induced settlements is provided as Figure 7.

Liquefaction Induced Settlements (Maximum Considered Earthquake)

CPT Number	CPT-1	CPT-2	CPT-3	CPT-4	CPT-4
Liquefaction Settlement (in)	0.80	0.19	0.33	0.00	0.41

7.5 Seismically Induced Settlement

Dynamic compaction of dry and loose sands may occur during a major earthquake. Typically, settlements occur in thick beds of such soils. The seismically induced settlement calculations were performed in accordance with the American Society of Civil Engineers, Technical Engineering and Design Guides as adapted from the US Army Corps of Engineers, No. 9.

The calculations provided herein in Figures 8 and 9 indicate that the soil above the historic high groundwater level of 9 feet would not be susceptible to significant settlement as a result of the Design Earthquake peak ground acceleration ($\frac{2}{3}PGA_M$).

7.6 Lateral Spreading

Due to the presence of the Dominguez Channel located to the west of the site, the potential for lateral spread was evaluated. Lateral spread occurs as a result of liquefaction induced lateral ground movement and typically occurs due to the presence of a slope comprised of and/or underlain by liquefiable soils.

Analysis of the potential for lateral spread was performed using the program CLiq (Version 1.7). The program utilizes the method proposed by Zhang et. al. (2004) to evaluate the potential for lateral spread and the resulting lateral displacements.

This method of analysis recommends evaluating the potential for lateral displacements to a distance of 50H from the slope, where H is the height of the slope. Beyond a horizontal distance of 50H lateral displacements due to the presence of a slope are not anticipated to occur. This method of analysis considers soils to a depth of twice the total slope height as potentially subject to lateral spread, up to a distance of 50H away from the toe of the slope.

The drainage channel is trapezoidal in shape and consists of two slopes approximately 12 feet in height inclined at a gradient of approximately 2:1 (estimated via satellite images). The proposed improvements have a minimum setback of 90 feet from the toe of the drainage channel. Therefore, lateral displacements using a horizontal setback of 90 feet was utilized.

Based on the results of the analyses it is anticipated that up to 10 inches of lateral displacements towards the drainage channel could occur during a Design Earthquake ground motion. The lateral displacements are anticipated to occur between depths of 10 and 15 feet below the ground surface. Calculations and output from CLiq are provided as Appendix C.

The grading and foundation design recommendations presented in this report are intended to minimize the effects of lateral spread on the proposed improvements.

7.7 Slope Stability

The topography at the site is relatively level and the topography in the immediate site vicinity slopes gently to the west-southwest. The County of Los Angeles Safety Element (Leighton, 1990) indicates the site is not located within an area identified as a "hillside area" or having a potential for slope instability. Additionally, the site is not within an area identified as having a potential for seismic slope instability (CDMG, 1999). There are no known landslides near the site, nor is the site in the path of any known or potential landslides. Therefore, the potential for slope stability hazards to adversely affect the proposed development is considered low.

7.8 Earthquake-Induced Flooding

Earthquake-induced flooding is inundation caused by failure of dams or other water-retaining structures due to earthquakes. Based on a review of the County of Los Angeles Safety Element (Leighton, 1990), the site is not located within a potential inundation area for an earthquake-induced dam failure. Therefore, the probability of earthquake-induced flooding is considered very low.

7.9 Tsunamis, Seiches, and Flooding

The site is not located within a coastal area. Therefore, tsunamis are not considered a significant hazard at the site.

Seiches are large waves generated in enclosed bodies of water in response to ground shaking. No major water-retaining structures are located immediately up gradient from the project site. Therefore, flooding resulting from a seismic-induced seiche is considered unlikely.

The site is within an area of minimal flooding (Zone X) as defined by the Federal Emergency Management Agency (FEMA, 2021; LACDPW, 2021).

7.10 Oil Fields & Methane Potential

Based on a review of the California Geologic Energy Management Division (CalGEM) Well Finder Website, the site is not located within an oil field and oil or gas wells are not documented in the immediate site vicinity (CalGEM, 2021). However, due to the voluntary nature of record reporting by the oil well drilling companies, wells may be improperly located or not shown on the location map and undocumented wells could be encountered during construction. Any wells encountered during construction will need to be properly abandoned in accordance with the current requirements of the CalGEM.

Since the site is not located within an oil field, the potential for methane or other volatile gases associated with oil and gas fields to be present at the site is considered low. However, as discussed in the Background section of this report (see Section 3), due to the site history there is a potential for low levels of volatile gases to be present, particularly during site grading. Should it be determined that a methane study or further environmental studies are required for the proposed development, it is recommended that a qualified methane or environmental consultant be retained to perform the study and provide mitigation measures as necessary.

7.11 Subsidence

Subsidence occurs when a large portion of land is displaced vertically, usually due to the withdrawal of groundwater, oil, or natural gas. Soils that are particularly subject to subsidence include those with high silt or clay content. The site is not located within an area of known ground subsidence. No large-scale extraction of groundwater, gas, oil, or geothermal energy is occurring or planned at the site or in the general site vicinity. There appears to be little or no potential for ground subsidence due to withdrawal of fluids or gases at the site.

8. CONCLUSIONS AND RECOMMENDATIONS

8.1 General

8.1.1 It is our opinion that neither soil nor geologic conditions were encountered during the investigation that would preclude construction of the proposed development provided the recommendations presented herein are followed and implemented during design and construction.

8.1.2 Up to 5 feet of existing artificial fill was encountered during the site investigation with localized areas of deeper fill of to 9 feet in depth. The existing fill encountered is believed to be the result of past grading and construction activities at the site. Deeper fill may exist in other areas of the site that were not directly explored. It is our opinion that the existing fill, in its present condition, is not suitable for direct support of proposed foundations or slabs. The existing fill and site soils are suitable for re-use as engineered fill provided the recommendations in the Grading section of this report are followed (see Section 8.4).

8.1.3 The enclosed liquefaction and seismically-induced settlement analyses indicate that the site soils could be susceptible to approximately ½ inch of total settlement as a result of the Design Earthquake peak ground acceleration ($\frac{2}{3}PGA_M$). Differential settlement at the foundation level is anticipated to be less than ¼ inch over a distance of 20 feet.

8.1.4 The results of the field data and laboratory testing indicate that the upper alluvial soils are relatively soft and compressible in their current condition (see Figure B5 thru B17) and could yield excessive static and differential settlements upon application of foundation loads.

8.1.5 The foundation design recommendations presented herein are intended to minimize the effects of settlement from liquefaction and consolidation on the proposed improvements. Based on our discussions with you, we understand that the preferred foundation system is a reinforced concrete mat foundation deriving support in newly placed engineered fill. Recommendations for a reinforced mat foundation system is provided in Sections 8.7 of this report.

8.1.6 For support of a mat foundation, it is recommended that the upper 6 feet of existing earth materials within the proposed building footprint areas be excavated and properly compacted for foundation and slab support. Deeper excavations should be conducted as necessary to remove deeper artificial fill or soft alluvial soil at the direction of the Geotechnical Engineer (a representative of Geocon). Proposed building foundations should be underlain by a minimum of 4 feet of newly placed engineered fill. The excavation should extend laterally a minimum distance of 3 feet beyond the building footprint area, including building appurtenances, or a distance equal to the depth of fill below the foundation, whichever is greater. The contractor should be aware that up to 9 feet of artificial fill was encountered in Boring B3. The limits of existing fill and/or soft alluvial soils removal will be verified by the Geocon representative during site grading activities. All excavations must be observed and approved in writing by the Geotechnical Engineer (a representative of Geocon).

8.1.7 It is anticipated that the recommended grading can be achieved with sloping measures. However, if excavations in close proximity to an adjacent property line and/or structure are required, special excavation measures in order to maintain lateral support of existing adjacent improvements will be required. Excavation recommendations are provided in the *Temporary Excavations* section of this report (Section 8.18).

8.1.8 Based on the relatively shallow groundwater table, the upper alluvial soils have the potential to be very moist and the grading contractor should be aware that the soils may be above optimum moisture content. If the soils are more than 3 percent above the optimum moisture content at the time of construction the soils will likely require some spreading and drying activities in order to achieve proper compaction. Bottom stabilization may also be necessary. Recommendations for bottom stabilization and earthwork are provided in the *Grading* section of this report (see Section 8.4).

8.1.9 Foundations for small outlying structures, such as block walls up to 6 feet in height, planter walls or trash enclosures, which will not be tied to the proposed structure, may be supported on conventional foundations deriving support on a minimum of 12 inches of newly placed engineered fill which extends laterally at least 12 inches beyond the foundation area. Where excavation and compaction cannot be performed or is undesirable, foundations may derive support directly in the competent undisturbed alluvial soils and should be deepened as necessary to maintain a minimum 12 inch embedment into the recommended bearing materials. If the soils exposed in the excavation bottom are soft or loose, compaction of the soils will be required prior to placing steel or concrete. Compaction of the foundation excavation bottom is typically accomplished with a compaction wheel or mechanical whacker and must be observed and approved in writing by a Geocon representative.

8.1.10 Where new paving is to be placed, it is recommended that all existing fill and soft alluvial soils be excavated and properly compacted for paving support. The client should be aware that excavation and compaction of all existing fill and soft alluvial soils in the area of new paving is not required; however, paving constructed over existing uncertified fill or unsuitable alluvial soil may experience increased settlement and/or cracking, and may therefore have a shorter design life and increased maintenance costs. As a minimum, the upper 12 inches of subgrade soil should be scarified and properly compacted for paving support. Paving recommendations are provided in *Preliminary Pavement Recommendations* section of this report (see Section 8.13).

8.1.11 Based on the shallow groundwater and impermeable nature of the fine grained soils which underly the site, infiltration of stormwater at this site is not considered feasible. Infiltration of stormwater at this site would be considered detrimental to the project. It is recommended that stormwater be retained, filtered, and discharged in accordance with the requirements of the local governing agency.

8.1.12 It should be noted that implementation of the recommendations presented herein is not intended to completely prevent damage to the structure during the occurrence of strong ground shaking as a result of nearby earthquakes. It is intended that the structure be designed in such a way that the amount of damage incurred as a result of strong ground shaking be minimized.

8.1.13 It is recommended that flexible utility connections be utilized for all rigid utilities to minimize or prevent damage to utilities from minor differential movements.

8.1.14 Once the design and foundation loading configuration for the proposed structure proceeds to a more finalized plan, the recommendations within this report should be reviewed and revised, if necessary. Based on the final foundation loading configurations, the potential for settlement should be reevaluated by this office.

8.1.15 Any changes in the design, location or elevation of improvements, as outlined in this report, should be reviewed by this office. Geocon should be contacted to determine the necessity for review and possible revision of this report.

8.2 Soil and Excavation Characteristics

8.2.1 The in-situ soils can be excavated with moderate effort using conventional excavation equipment. Some caving should be anticipated in unshored excavations, especially where granular soils are encountered.

8.2.2 It is the responsibility of the contractor to ensure that all excavations and trenches are properly shored and maintained in accordance with applicable OSHA rules and regulations to maintain safety and maintain the stability of existing adjacent improvements.

8.2.3 All onsite excavations must be conducted in such a manner that potential surcharges from existing structures, construction equipment, and vehicle loads are resisted. The surcharge area may be defined by a 1:1 projection down and away from the bottom of an existing foundation or vehicle load. Penetrations below this 1:1 projection will require special excavation measures such as sloping or shoring. Excavation recommendations are provided in the *Temporary Excavations* section of this report (see Section 8.18).

8.2.4 The upper 5 feet of existing site soils encountered during the investigation are considered to have a "medium" expansive potential (EI = 63) and are classified as "expansive" in accordance with the 2019 California Building Code (CBC) Section 1803.5.3. The recommendations presented herein assume that the building foundations and slabs will derive support in these materials.

8.3 Minimum Resistivity, pH, and Water-Soluble Sulfate

8.3.1 Potential of Hydrogen (pH) and resistivity testing, as well as chloride content testing, were performed on representative samples of on-site material to generally evaluate the corrosion potential to surface utilities. The tests were performed in accordance with California Test Method Nos. 643 and 422 and indicate that the soils are considered "moderately corrosive" to "severely corrosive" with respect to corrosion of buried ferrous metals on site. The results are presented in Appendix B (Figure B23) and should be considered for design of underground structures. Due to the corrosive potential of the soils, it is suggested that ABS pipes be considered in lieu of cast-iron for subdrains and retaining wall drains beneath the structure.

8.3.2 Laboratory tests were performed on representative samples of the site materials to measure the percentage of water-soluble sulfate content. Results from the laboratory water-soluble sulfate tests are presented in Appendix B (Figure B23) and indicate that the on-site materials possess a sulfate exposure class of "S0" to concrete structures as defined by 2019 CBC Section 1904 and ACI 318-14 Table 19.3.1.1.

8.3.3 Geocon West, Inc. does not practice in the field of corrosion engineering and mitigation. If corrosion sensitive improvements are planned, it is recommended that a corrosion engineer be retained to evaluate corrosion test results and incorporate the necessary precautions to avoid premature corrosion of buried metal pipes and concrete structures in direct contact with the soils.

8.4 Grading

8.4.1 Grading is anticipated to include preparation of building pads and paving subgrade, excavation of site soils for proposed foundations and utility trenches, as well as placement of backfill for utility trenches.

8.4.2 A preconstruction conference should be held at the site prior to the beginning of grading operations with the owner, contractor, civil engineer and soil engineer in attendance. Special soil handling requirements can be discussed at that time.

8.4.3 Earthwork should be observed, and compacted fill tested by representatives of Geocon West, Inc. The existing fill and alluvial soils encountered during exploration are suitable for reuse as engineered fill, provided any encountered oversize material (greater than 6 inches) and any encountered deleterious debris is removed.

8.4.4 Grading should commence with the removal of all existing vegetation and existing improvements from the area to be graded. Deleterious debris such as wood and root structures should be exported from the site and should not be mixed with the fill soils. Asphalt and concrete should not be mixed with the fill soils unless approved by the Geotechnical Engineer. All existing underground improvements planned for removal should be completely excavated and the resulting depressions properly backfilled in accordance with the procedures described herein. Once a clean excavation bottom has been established it must be observed and approved in writing by the Geotechnical Engineer (a representative of Geocon West, Inc.).

8.4.5 For support of a mat foundation, it is recommended that the upper 6 feet of existing earth materials within the proposed building footprint areas be excavated and properly compacted for foundation and slab support. Deeper excavations should be conducted as necessary to remove deeper artificial fill or soft alluvial soil at the direction of the Geotechnical Engineer (a representative of Geocon). Proposed building foundations should be underlain by a minimum of 4 feet of newly placed engineered fill. The excavation should extend laterally a minimum distance of 3 feet beyond the building footprint area, including building appurtenances, or a distance equal to the depth of fill below the foundation, whichever is greater. The contractor should be aware that up to 9 feet of artificial fill was encountered in Boring B3. The limits of existing fill and/or soft alluvial soils removal will be verified by the Geocon representative during site grading activities.

8.4.6 All excavations must be observed and approved in writing by the Geotechnical Engineer (a representative of Geocon). If determined to be excessively soft, stabilization of the bottom of the excavation may be required in order to provide a firm working surface upon which engineered fill can be placed and heavy equipment can operate.

8.4.7 Prior to placing fill or constructing proposed improvements, a stable excavation bottom must be established. In areas where the subgrade is saturated or soft, proper compaction will likely not be possible or achieved in a timely manner without introducing stabilization measures. If subgrade stabilization is required at the excavation bottom, rubber tire equipment should not be allowed in the excavation bottom until it is stabilized or extensive soil disturbance could result. It is suggested that excavation and grading be performed during the summer season to promote moisture control of the soils. In addition, the use of track equipment should be used to minimize disturbance to the soils at the excavation bottom.

8.4.8 Bottom stabilization, if necessary, may be achieved placing a thin lift of 3- to 6-inch-diameter crushed angular rock into the soft excavation bottom. The use of crushed concrete will also be acceptable. The crushed rock should be spread thinly across the excavation bottom and pressed into the soils by track rolling or wheel rolling with heavy equipment. It is very important that voids between the rock fragments are not created so the rock must be thoroughly pressed or blended into the soils. All subgrade soils must be properly compacted and proof-rolled in the presence of the Geotechnical Engineer (a representative of Geocon West, Inc.).

8.4.9 An alternative method of subgrade stabilization may be accomplished by placing a one-foot-thick layer of washed, angular 3/4-inch gravel atop a stabilization fabric (Mirafi 500X or equivalent) subsequent to subgrade approval. Stabilization fabric should also be placed over the top of the gravel. This procedure should be conducted in sections until the entire excavation bottom has been blanketed by fabric and gravel. Heavy equipment may operate on the gravel once it has been placed. The gravel should be compacted to a dense state using a vibratory drum roller. It is recommended that the contractor meet with the Geotechnical Engineer to discuss this procedure in more detail.

8.4.10 The upper soils encountered during site exploration were moist to wet and the grading contractor should be aware that the existing soils are currently above optimum moisture content. Conditions could change seasonally. If the soils are more than 3 percent above the optimum moisture content at the time of construction the soils will likely require spreading, processing, and drying activities in order to achieve proper compaction.

8.4.11 All fill and backfill soils should be placed in horizontal loose layers approximately 6 to 8 inches thick, moisture conditioned to near 2 percent above optimum moisture content, and properly compacted to a minimum of 90 percent of the maximum dry density per ASTM D 1557 (latest edition).

8.4.12 It is anticipated that stable excavations for the recommended grading can be achieved with sloping measures. However, if excavations in close proximity to an adjacent property line and/or structure are required, special excavation measures may be necessary in order to maintain lateral support of offsite improvements. Excavation recommendations are provided in the *Temporary Excavations* section of this report (see Section 8.18).

8.4.13 Although not anticipated for this project, all imported fill shall be observed, tested, and approved by Geocon West, Inc. prior to bringing soil to the site. Rocks larger than 6 inches in diameter shall not be used in the fill. If necessary, import soils used as structural fill should have an expansion index less than 50 and corrosivity properties that are equally or less detrimental to that of the existing onsite soils (see Figure B23).

8.4.14. Where new paving is to be placed, it is recommended that all existing fill and soft alluvium be excavated and properly compacted for paving support. As a minimum, the upper 12 inches of soil should be scarified, moisture conditioned to near two percent over optimum moisture content, and compacted to at least 92 percent relative compaction, as determined by ASTM Test Method D 1557 (latest edition). Paving recommendations are provided in *Preliminary Pavement Recommendations* section of this report (see Section 8.13).

8.4.15 Foundations for small outlying structures, such as block walls up to 6 feet in height, planter walls or trash enclosures, which will not be tied to the proposed structure, may be supported on conventional foundations deriving support on a minimum of 12 inches of newly placed engineered fill which extends laterally at least 12 inches beyond the foundation area. Where excavation and compaction cannot be performed or is undesirable, foundations may derive support directly in the competent undisturbed alluvial soils and should be deepened as necessary to maintain a minimum 12 inch embedment into the recommended bearing materials. If the soils exposed in the excavation bottom are soft or loose, compaction of the soils will be required prior to placing steel or concrete. Compaction of the foundation excavation bottom is typically accomplished with a compaction wheel or mechanical whacker and must be observed and approved by a Geocon representative.

8.4.16 It is recommended that flexible utility connections be utilized for all rigid utilities to minimize or prevent damage to utilities from minor differential movements. Utility trenches should be properly backfilled in accordance with the requirements of the Green Book (latest edition). The pipe should be bedded with clean sands (Sand Equivalent greater than 30) to a depth of at least 1 foot over the pipe, and the bedding material must be inspected and approved in writing by the Geotechnical Engineer (a representative of Geocon). The use of gravel is not acceptable unless used in conjunction with filter fabric to prevent the gravel from having direct contact with soil. The remainder of the trench backfill may be derived from onsite soil or approved import soil, compacted as necessary, until the required compaction is obtained. The use of minimum 2-sack slurry as backfill is also acceptable. Prior to placing any bedding materials or pipes, the trench excavation bottom must be observed and approved in writing by the Geotechnical Engineer (a representative of Geocon).

8.4.17 All trench and foundation excavation bottoms must be observed and approved in writing by the Geotechnical Engineer (a representative of Geocon), prior to placing bedding sands, fill, steel, gravel, or concrete.

8.5 Shrinkage

8.5.1 Shrinkage results when a volume of material removed at one density is compacted to a higher density. A shrinkage factor between 10 and 15 percent should be anticipated when excavating and compacting the upper 5 feet of existing earth materials on the site to an average relative compaction of 92 percent.

8.5.2 If import soils will be utilized in the building pad, the soils must be placed uniformly and at equal thickness at the direction of the Geotechnical Engineer (a representative of Geocon West, Inc.). Soils can be borrowed from non-building pad areas and later replaced with imported soils.

8.6 Mat Foundation Design

8.6.1 Subsequent to the recommended grading, a reinforced concrete mat foundation may be utilized for support of the proposed structures. The reinforced concrete mat foundation should derive support in the newly placed engineered fill and be underlain by at least 4 feet of newly placed engineered fill.

8.6.2 Foundation excavations should be observed and approved in writing by the Geotechnical Engineer (a representative of Geocon West, Inc.), prior to the placement of reinforcing steel and concrete to verify that the excavations and exposed soil conditions are consistent with those anticipated. If unanticipated soil conditions are encountered, foundation modifications may be required.

8.6.3 It is anticipated that the mat foundation constructed for the on-grade structure will impart an average pressure between 2,000 psf to 3,500 psf. The recommended maximum allowable bearing value is 3,500 psf. The allowable bearing pressure may be increased by up to one-third for transient loads due to wind or seismic forces.

8.6.4 A vertical modulus of subgrade reaction of 100 pci may be used in the design of mat foundations deriving support in competent alluvial soils. This value is a unit value for use with a 1-foot square footing. The modulus should be reduced in accordance with the following equation when used with larger foundations:

$$K_R = K\left[\frac{B+1}{2B}\right]^2$$

where: K_R = reduced subgrade modulus
K = unit subgrade modulus
B = foundation width (in feet)

8.6.5 The thickness of and reinforcement for the mat foundation should be designed by the project structural engineer.

8.6.6 For seismic design purposes, a coefficient of friction of 0.35 may be utilized between the concrete mat and newly placed engineered fill without a moisture barrier, and 0.15 for slabs underlain by a moisture barrier.

8.6.7 The enclosed liquefaction settlement analyses indicate that the site soils could be susceptible to less than ½ inch of total seismic settlement as a result of the Design Earthquake peak ground acceleration ($⅔PGA_M$). Differential settlement at the foundation level is anticipated to be less than ¼ inches over a distance of 20 feet. The foundation design recommendations presented herein are intended to minimize the effects of settlement on proposed improvements.

8.6.8 The maximum expected total settlement for a structure support on a mat foundation system designed with the maximum allowable bearing value of 3,500 psf and deriving support in the recommended bearing materials is estimated to be approximately 2 inches and occur below the heaviest loaded structural element. A majority of the settlement of the foundation system is expected to occur on initial application of loading; however, additional settlements are expected within the first twelve months. Differential settlement is not expected to exceed 1 inch over a distance of 20 feet.

8.6.9 Based on these considerations is it recommended that the proposed structure, designed with a maximum allowable bearing value of 3,500 psf, be designed for a combined static and seismically induced differential settlement of 1 ½ inch over a distance of 20 feet.

8.6.10 This office should be provided a copy of the final construction plans so that the excavation recommendations presented herein could be properly reviewed and revised if necessary.

8.6.11 Once the design and foundation loading configurations for the proposed structures proceeds to a more finalized plan, the estimated settlements presented in this report should be reviewed and revised, if necessary. If the final foundation loading configurations are greater than the assumed loading conditions, the potential for settlement should be reevaluated by this office.

8.7 Miscellaneous Foundations

8.7.1 Foundations for small outlying structures, such as block walls up to 6 feet in height, planter walls or trash enclosures, which will not be tied to the proposed structure, may be supported on conventional foundations deriving support on a minimum of 12 inches of newly placed engineered fill which extends laterally at least 12 inches beyond the foundation area. Where excavation and compaction cannot be performed or is undesirable, foundations may derive support directly in the competent undisturbed alluvial soils, and should be deepened as necessary to maintain a minimum 12 inch embedment into the recommended bearing materials.

8.7.2 If the soils exposed in the excavation bottom are soft, compaction of the soft soils will be required prior to placing steel or concrete. Compaction of the foundation excavation bottom is typically accomplished with a compaction wheel or mechanical whacker and must be observed and approved by a Geocon representative. Miscellaneous foundations may be designed for a bearing value of 1,500 psf, and should be a minimum of 12 inches in width, 24 ,inches in depth below the lowest adjacent grade and 12 inches into the recommended bearing material. The allowable bearing pressure may be increased by up to one-third for transient loads due to wind or seismic forces.

8.7.3 Foundation excavations should be observed and approved in writing by the Geotechnical Engineer (a representative of Geocon West, Inc.), prior to the placement of reinforcing steel and concrete to verify that the excavations and exposed soil conditions are consistent with those anticipated.

8.8 Lateral Design

8.8.1 Resistance to lateral loading may be provided by friction acting at the base of foundations, slabs and by passive earth pressure. An allowable coefficient of friction of 0.35 may be used with the dead load forces in the undisturbed alluvial soils and newly placed engineered fill.

8.8.2 Passive earth pressure for the sides of foundations and slabs poured against newly placed engineered fill or undisturbed alluvial soils may be computed as an equivalent fluid having a density of 230 pounds per cubic foot (pcf) with a maximum earth pressure of 2,300 psf. When combining passive and friction for lateral resistance, the passive component should be reduced by one-third. A one-third increase in the passive value may be used for wind or seismic loads.

8.9 Concrete Slabs-on-Grade

8.9.1 Exterior concrete slabs-on-grade subject to vehicle loading should be designed in accordance with the recommendations in the *Preliminary Pavement Recommendations* section of this report (Section 8.10).

8.9.2 Slabs-on-grade at the ground surface that may receive moisture-sensitive floor coverings or may be used to store moisture-sensitive materials should be underlain by a vapor retarder placed directly beneath the slab. The vapor retarder and acceptable permeance should be specified by the project architect or developer based on the type of floor covering that will be installed. The vapor retarder design should be consistent with the guidelines presented in Section 9.3 of the American Concrete Institute's (ACI) Guide for Concrete Slabs that Receive Moisture-Sensitive Flooring Materials (ACI 302.2R-06) and should be installed in general conformance with ASTM E 1643 (latest edition) and the manufacturer's recommendations. A minimum thickness of 15 mils extruded polyolefin plastic is recommended; vapor retarders which contain recycled content or woven materials are not recommended. The vapor retarder should have a permeance of less than 0.01 perms demonstrated by testing before and after mandatory conditioning. The vapor retarder should be installed in direct contact with the concrete slab with proper perimeter seal. If the Los Angeles Green Building Code requirements apply to this project, the vapor retarder should be underlain by 4 inches of clean aggregate. It is important that the vapor retarder be puncture resistant since it will be in direct contact with angular gravel. As an alternative to the clean aggregate suggested in the Los Angeles Green Building Code, it is our opinion that the concrete slab-on-grade may be underlain by a vapor retarder over 4 inches of clean sand (sand equivalent greater than 30), since the sand will serve a capillary break and will minimize the potential for punctures and damage to the vapor barrier.

8.9.3 For seismic design purposes, a coefficient of friction of 0.35 may be utilized between concrete slabs and subgrade soils without a moisture barrier, and 0.15 for slabs underlain by a moisture barrier.

8.9.4 Exterior slabs, not subject to traffic loads, should be at least 4 inches thick and reinforced with No. 3 steel reinforcing bars placed 18 inches on center in both horizontal directions, positioned near the slab midpoint. Prior to construction of slabs, the upper 12 inches of subgrade should be moistened to optimum moisture content and properly compacted to at least 92 percent relative compaction, as determined by ASTM Test Method D 1557 (latest edition). Crack control joints should be spaced at intervals not greater than 10 feet and should be constructed using saw-cuts or other methods as soon as practical following concrete placement. Crack control joints should extend a minimum depth of one-fourth the slab thickness. The project structural engineer should design construction joints as necessary.

8.9.5 Due to the expansive potential of the anticipated subgrade soils, the moisture content of the slab subgrade should be maintained and sprinkled as necessary to maintain a moist condition as would be expected in any concrete placement. Furthermore, consideration should be given to doweling slabs into adjacent curbs and foundations to minimize movements and offsets which could lead to a potential tripping hazard.

8.9.6 The recommendations of this report are intended to reduce the potential for cracking of slabs due to settlement. However, even with the incorporation of the recommendations presented herein, foundations, stucco walls, and slabs-on-grade may exhibit some cracking due to minor soil movement and/or concrete shrinkage. The occurrence of concrete shrinkage cracks is independent of the supporting soil characteristics. Their occurrence may be reduced and/or controlled by limiting the slump of the concrete, proper concrete placement and curing, and by the placement of crack control joints at periodic intervals, in particular, where re-entrant slab corners occur.

8.10 Preliminary Paving Design

8.10.1 Where new paving is to be placed, it is recommended that all existing fill and soft alluvium materials be excavated and properly compacted for paving support. The client should be aware that excavation and compaction of all existing artificial fill and soft alluvium in the area of new paving is not required; however, paving constructed over existing uncertified fill or unsuitable alluvium material may experience increased settlement and/or cracking, and may therefore have a shorter design life and increased maintenance costs. As a minimum, the upper 12 inches of paving subgrade should be scarified, moisture conditioned to at least 2 percent above optimum moisture content, and properly compacted to at least 92 percent relative compaction, as determined by ASTM Test Method D 1557 (latest edition).

8.10.2 The following pavement sections are based on an assumed R-Value of 20. Once site grading activities are complete an R-Value should be obtained by laboratory testing to confirm the properties of the soils serving as paving subgrade, prior to placing pavement.

8.10.3 The Traffic Indices listed below are estimates. Geocon does not practice in the field of traffic engineering. The actual Traffic Index for each area should be determined by the project civil engineer. If pavement sections for Traffic Indices other than those listed below are required, Geocon should be contacted to provide additional recommendations. Pavement thicknesses were determined following procedures outlined in the *California Highway Design Manual* (Caltrans). It is anticipated that the majority of traffic will consist of automobile and large truck traffic.

PRELIMINARY PAVEMENT DESIGN SECTIONS

Location	Estimated Traffic Index (TI)	Asphalt Concrete (inches)	Class 2 Aggregate Base (inches)
Automobile Parking and Driveways	4.0	3.0	4.0
Trash Truck & Fire Lanes	7.0	4.0	12.0

8.10.4 Asphalt concrete should conform to Section 203-6 of the "*Standard Specifications for Public Works Construction"* (Green Book). Class 2 aggregate base materials should conform to Section 26-1.02A of the "*Standard Specifications of the State of California, Department of Transportation"* (Caltrans). The use of Crushed Miscellaneous Base (CMB) in lieu of Class 2 aggregate base is acceptable. Crushed Miscellaneous Base should conform to Section 200-2.4 of the "*Standard Specifications for Public Works Construction"* (Green Book).

8.10.5 Unless specifically designed and evaluated by the project structural engineer, where exterior concrete paving will be utilized for support of vehicles, it is recommended that the concrete be a minimum of 6 inches of concrete reinforced with No. 3 steel reinforcing bars placed 18 inches on center in both horizontal directions. Concrete paving supporting vehicular traffic should be underlain by a minimum of 4 inches of aggregate base and a properly compacted subgrade. As a minimum, the upper 12 inches of paving subgrade should be scarified, moisture conditioned to 2 percent above optimum moisture content, and properly compacted to at least 92 percent relative compaction, as determined by ASTM Test Method D 1557 (latest edition). The base material should be compacted to 95 percent relative compaction as determined by ASTM Test Method D 1557 (latest edition).

8.10.6 The performance of pavements is highly dependent upon providing positive surface drainage away from the edge of pavements. Ponding of water on or adjacent to the pavement will likely result in saturation of the subgrade materials and subsequent cracking, subsidence and pavement distress. If planters are planned adjacent to paving, it is recommended that the perimeter curb be extended at least 12 inches below the bottom of the aggregate base to minimize the introduction of water beneath the paving.

8.11 Retaining Wall Design

8.11.1 The recommendations presented below are generally applicable to the design of rigid concrete or masonry retaining walls having a maximum height of 5 feet. In the event that walls significantly higher than 5 feet are planned, Geocon should be contacted for additional recommendations.

8.11.2 Retaining wall foundations should be designed in accordance with the recommendations provided in the *Foundation Design* section of this report (see Sections 8.6 through 8.9).

8.11.3 Retaining walls with a level backfill surface that are not restrained at the top should be designed utilizing a triangular distribution of pressure (active pressure). Restrained walls are those that are not allowed to rotate more than 0.001H (where H equals the height of the retaining portion of the wall in feet) at the top of the wall. Where walls are restrained from movement at the top, walls may be designed utilizing a triangular distribution of pressure (at-rest pressure). The table on the following page presents recommended pressures to be used in retaining wall design.

RETAINING WALL WITH LEVEL BACKFILL SURFACE

HEIGHT OF RETAINING WALL (Feet)	ACTIVE PRESSURE EQUIVALENT FLUID PRESSURE (Pounds Per Cubic Foot)	AT-REST PRESSURE EQUIVALENT FLUID PRESSURE (Pounds Per Cubic Foot)
Up to 5	30	74

8.11.4 The wall pressures provided above assume that the proposed retaining walls will support a wedge of engineered fill derived from onsite soils. If import soil will be used to backfill proposed retaining walls, revised earth pressures may be required to account for the geotechnical properties of the import soil used as engineered fill. This should be evaluated once the use of import soil is established. All imported fill shall be observed, tested, and approved by Geocon West, Inc. prior to bringing soil to the site.

8.11.5 The wall pressures provided above assume that the retaining wall will be properly drained preventing the buildup of hydrostatic pressure. If retaining wall drainage is not implemented, the equivalent fluid pressure to be used in design of undrained walls is 100 pcf. The value includes hydrostatic pressures plus buoyant lateral earth pressures.

8.11.6 Additional active pressure should be added for a surcharge condition due to sloping ground, vehicular traffic or adjacent structures and should be designed for each condition as the project progresses. Surcharges may be evaluated using Section 8.19 of this report. Once the design becomes more finalized, an addendum letter can be prepared revising recommendations and addressing specific surcharge conditions throughout the project, if necessary.

8.12 Retaining Wall Drainage

8.12.1 Where not designed for hydrostatic pressure, retaining walls should be provided with a drainage system. At the base of the drain system, a subdrain covered with a minimum of 12 inches of gravel should be installed, and a compacted fill blanket or other seal placed at the surface (see Figure 10). The clean bottom and subdrain pipe, behind a retaining wall, should be observed by the Geotechnical Engineer (a representative of Geocon), prior to placement of gravel or compacting backfill.

8.12.2 As an alternative, a plastic drainage composite such as Miradrain or equivalent may be installed in continuous, 4-foot-wide columns along the entire back face of the wall, at 8 feet on center. The top of these drainage composite columns should terminate approximately 18 inches below the ground surface, where either hardscape or a minimum of 18 inches of relatively cohesive material should be placed as a cap (see Figure 11). These vertical columns of drainage material would then be connected at the bottom of the wall to a collection panel or a 1-cubic-foot rock pocket drained by a 4-inch subdrain pipe.

8.12.3 Subdrainage pipes at the base of the retaining wall drainage system should outlet to an acceptable location via controlled drainage structures.

8.12.4 Moisture affecting below grade walls is one of the most common post-construction complaints. Poorly applied or omitted waterproofing can lead to efflorescence or standing water. Particular care should be taken in the design and installation of waterproofing to avoid moisture problems, or actual water seepage into the structure through any normal shrinkage cracks which may develop in the concrete walls, floor slab, foundations and/or construction joints. The design and inspection of the waterproofing is not the responsibility of the geotechnical engineer. A waterproofing consultant should be retained in order to recommend a product or method, which would provide protection to subterranean walls, floor slabs and foundations.

8.13 Elevator Pit Design

8.13.1 The elevator pit slab and retaining wall should be designed by the project structural engineer. Elevator pit walls may be designed in accordance with the recommendations in the *Retaining Wall Design* section of this report (see Section 8.14).

8.13.2 Additional active pressure should be added for a surcharge condition due to sloping ground, vehicular traffic or adjacent foundations and should be designed for each condition as the project progresses.

8.13.3 If retaining wall drainage is to be provided, the drainage system should be designed in accordance with the *Retaining Wall Drainage* section of this report (see Section 8.15).

8.13.4 It is suggested that the exterior walls and slab be waterproofed to prevent excessive moisture inside of the elevator pit. Waterproofing design and installation is not the responsibility of the geotechnical engineer.

8.14 Elevator Piston

8.14.1 If a plunger-type elevator piston is installed for this project, a deep drilled excavation will be required. It is important to verify that the drilled excavation is not situated immediately adjacent to a foundation, or the drilled excavation could compromise the existing foundation support, especially if the drilling is performed subsequent to the foundation construction.

8.14.2 Due to the preliminary nature of the project at this time, it is unknown if a plunger-type elevator piston will be included for this project. If in the future it is determined that a plunger-type elevator piston will be constructed, the location of the proposed elevator should be reviewed by the Geotechnical Engineer to evaluate the setback from foundations. Additional recommendations will be provided as necessary.

8.14.3 Some caving is anticipated in the granular soils below a depth of 20 feet. The contractor should be prepared to use casing and should have it readily available at the commencement of drilling activities. Continuous observation of the drilling and installation of the elevator piston by the Geotechnical Engineer (a representative of Geocon West, Inc.) is required.

8.14.4 The annular space between the piston casing and drilled excavation wall should be filled with a minimum of 1½-sack slurry pumped from the bottom up. As an alternative, pea gravel may be utilized. The use of soil to backfill the annular space is not acceptable.

8.15 Temporary Excavations

8.15.1 Excavations on the order of 6 feet in height are generally anticipated during grading activities, and isolated excavations up to 9 feet in height may also be required. The excavations are expected to expose artificial fill and alluvial soils, which may be subject to some caving where granular soils are exposed. Temporary vertical excavations up to 5 feet in height may be attempted where not surcharged by adjacent traffic or structures.

8.15.2 Vertical excavations greater than 5 feet or where surcharged by existing structures will require sloping or shoring measures in order to provide a stable excavation. Where sufficient space is available, temporary unsurcharged embankments could be sloped back at a uniform 1:1 slope gradient or flatter up to a maximum of 9 feet in height. A uniform slope does not have a vertical portion. Where space is limited, shoring measures will be required. *Shoring* recommendations can be provided under separate cover if necessary.

8.15.3 If excavations in close proximity to an adjacent property line and/or structure are required, special excavation measures such as slot-cutting or shoring may be necessary in order to maintain lateral support of offsite improvements. Recommendations for slot-cutting and shoring can be provided under separate cover.

8.15.4 Where sloped embankments are utilized, the top of the slope should be barricaded to prevent vehicles and storage loads at the top of the slope within a horizontal distance equal to the height of the slope. If the temporary construction embankments are to be maintained during the rainy season, berms are suggested along the tops of the slopes where necessary to prevent runoff water from entering the excavation and eroding the slope faces. Geocon personnel should inspect the soils exposed in the cut slopes during excavation so that modifications of the slopes can be made if variations in the soil conditions occur. All excavations should be stabilized within 30 days of initial excavation.

8.16 Surcharge from Adjacent Structures and Improvements

8.16.1 Additional pressure should be added for a surcharge condition due to sloping ground, vehicular traffic or adjacent structures and should be designed for each condition as the project progresses.

8.16.2 It is recommended that line-load surcharges from adjacent wall footings, use horizontal pressures generated from NAV-FAC DM 7.2. The governing equations are:

$$For\ {}^{x}/_{H} \leq 0.4$$

$$\sigma_H(z) = \frac{0.20 \times \left(\frac{z}{H}\right)}{\left[0.16 + \left(\frac{z}{H}\right)^2\right]^2} \times \frac{Q_L}{H}$$

and

$$For\ {}^{x}/_{H} > 0.4$$

$$\sigma_H(z) = \frac{1.28 \times \left(\frac{x}{H}\right)^2 \times \left(\frac{z}{H}\right)}{\left[\left(\frac{x}{H}\right)^2 + \left(\frac{z}{H}\right)^2\right]^2} \times \frac{Q_L}{H}$$

where x is the distance from the face of the excavation or wall to the vertical line-load, H is the distance from the bottom of the footing to the bottom of excavation or wall, z is the depth at which the horizontal pressure is desired, Q_L is the vertical line-load and $\sigma_{H(z)}$ is the horizontal pressure at depth z.

8.16.3 It is recommended that vertical point-loads, from construction equipment outriggers or adjacent building columns use horizontal pressures generated from NAV-FAC DM 7.2. The governing equations are:

$$For\ {}^{x}/_{H} \leq 0.4$$

$$\sigma_H(z) = \frac{0.28 \times \left(\frac{z}{H}\right)^2}{\left[0.16 + \left(\frac{z}{H}\right)^2\right]^3} \times \frac{Q_P}{H^2}$$

and

$$For\ {}^{x}/_{H} > 0.4$$

$$\sigma_H(z) = \frac{1.77 \times \left(\frac{x}{H}\right)^2 \times \left(\frac{z}{H}\right)^2}{\left[\left(\frac{x}{H}\right)^2 + \left(\frac{z}{H}\right)^2\right]^3} \times \frac{Q_P}{H^2}$$

then

$$\sigma'_H(z) = \sigma_H(z) cos^2(1.1\theta)$$

where x is the distance from the face of the excavation/wall to the vertical point-load, H is distance from the outrigger/bottom of column footing to the bottom of excavation, z is the depth at which the horizontal pressure is desired, Qp is the vertical point-load, $\sigma_H(z)$ is the horizontal pressure at depth z, θ is the angle between a line perpendicular to the excavation/wall and a line from the point-load to location on the excavation/wall where the surcharge is being evaluated, and $\sigma_H(z)$ is the horizontal pressure at depth z.

8.17 Surface Drainage

8.17.1 Proper surface drainage is critical to the future performance of the project. Uncontrolled infiltration of irrigation excess and storm runoff into the soils can adversely affect the performance of the planned improvements. Saturation of a soil can cause it to lose internal shear strength and increase its compressibility, resulting in a change in the original designed engineering properties. Proper drainage should be maintained at all times.

8.17.2 All site drainage should be collected and controlled in non-erosive drainage devices. Drainage should not be allowed to pond anywhere on the site, and especially not against any foundation or retaining wall. The site should be graded and maintained such that surface drainage is directed away from structures in accordance with 2019 CBC 1804.4 or other applicable standards. In addition, drainage should not be allowed to flow uncontrolled over any descending slope. Discharge from downspouts, roof drains and scuppers are not recommended onto unprotected soils within 5 feet of the building perimeter. Planters which are located adjacent to foundations should be sealed to prevent moisture intrusion into the soils providing foundation support. Landscape irrigation is not recommended within 5 feet of the building perimeter footings except when enclosed in protected planters.

8.17.3 Positive site drainage should be provided away from structures, pavement, and the tops of slopes to swales or other controlled drainage structures. The building pad and pavement areas should be fine graded such that water is not allowed to pond.

8.17.4 Landscaping planters immediately adjacent to paved areas are not recommended due to the potential for surface or irrigation water to infiltrate the pavement's subgrade and base course. Either a subdrain, which collects excess irrigation water and transmits it to drainage structures, or impervious above-grade planter boxes should be used. In addition, where landscaping is planned adjacent to the pavement, it is recommended that consideration be given to providing a cutoff wall along the edge of the pavement that extends at least 12 inches below the base material.

8.18 Plan Review

8.18.1 Grading, foundation, and shoring plans should be reviewed by the Geotechnical Engineer (a representative of Geocon West, Inc.), prior to finalization to verify that the plans have been prepared in substantial conformance with the recommendations of this report and to provide additional analyses or recommendations.

LIMITATIONS AND UNIFORMITY OF CONDITIONS

1. The recommendations of this report pertain only to the site investigated and are based upon the assumption that the soil conditions do not deviate from those disclosed in the investigation. If any variations or undesirable conditions are encountered during construction, or if the proposed construction will differ from that anticipated herein, Geocon West, Inc. should be notified so that supplemental recommendations can be given. The evaluation or identification of the potential presence of hazardous or corrosive materials was not part of the scope of services provided by Geocon West, Inc.

2. This report is issued with the understanding that it is the responsibility of the owner, or of his representative, to ensure that the information and recommendations contained herein are brought to the attention of the architect and engineer for the project and incorporated into the plans, and the necessary steps are taken to see that the contractor and subcontractors carry out such recommendations in the field.

3. The findings of this report are valid as of the date of this report. However, changes in the conditions of a property can occur with the passage of time, whether they are due to natural processes or the works of man on this or adjacent properties. In addition, changes in applicable or appropriate standards may occur, whether they result from legislation or the broadening of knowledge. Accordingly, the findings of this report may be invalidated wholly or partially by changes outside our control. Therefore, this report is subject to review and should not be relied upon after a period of three years.

4. The firm that performed the geotechnical investigation for the project should be retained to provide testing and observation services during construction to provide continuity of geotechnical interpretation and to check that the recommendations presented for geotechnical aspects of site development are incorporated during site grading, construction of improvements, and excavation of foundations. If another geotechnical firm is selected to perform the testing and observation services during construction operations, that firm should prepare a letter indicating their intent to assume the responsibilities of project geotechnical engineer of record. A copy of the letter should be provided to the regulatory agency for their records. In addition, that firm should provide revised recommendations concerning the geotechnical aspects of the proposed development, or a written acknowledgement of their concurrence with the recommendations presented in our report. They should also perform additional analyses deemed necessary to assume the role of Geotechnical Engineer of Record.

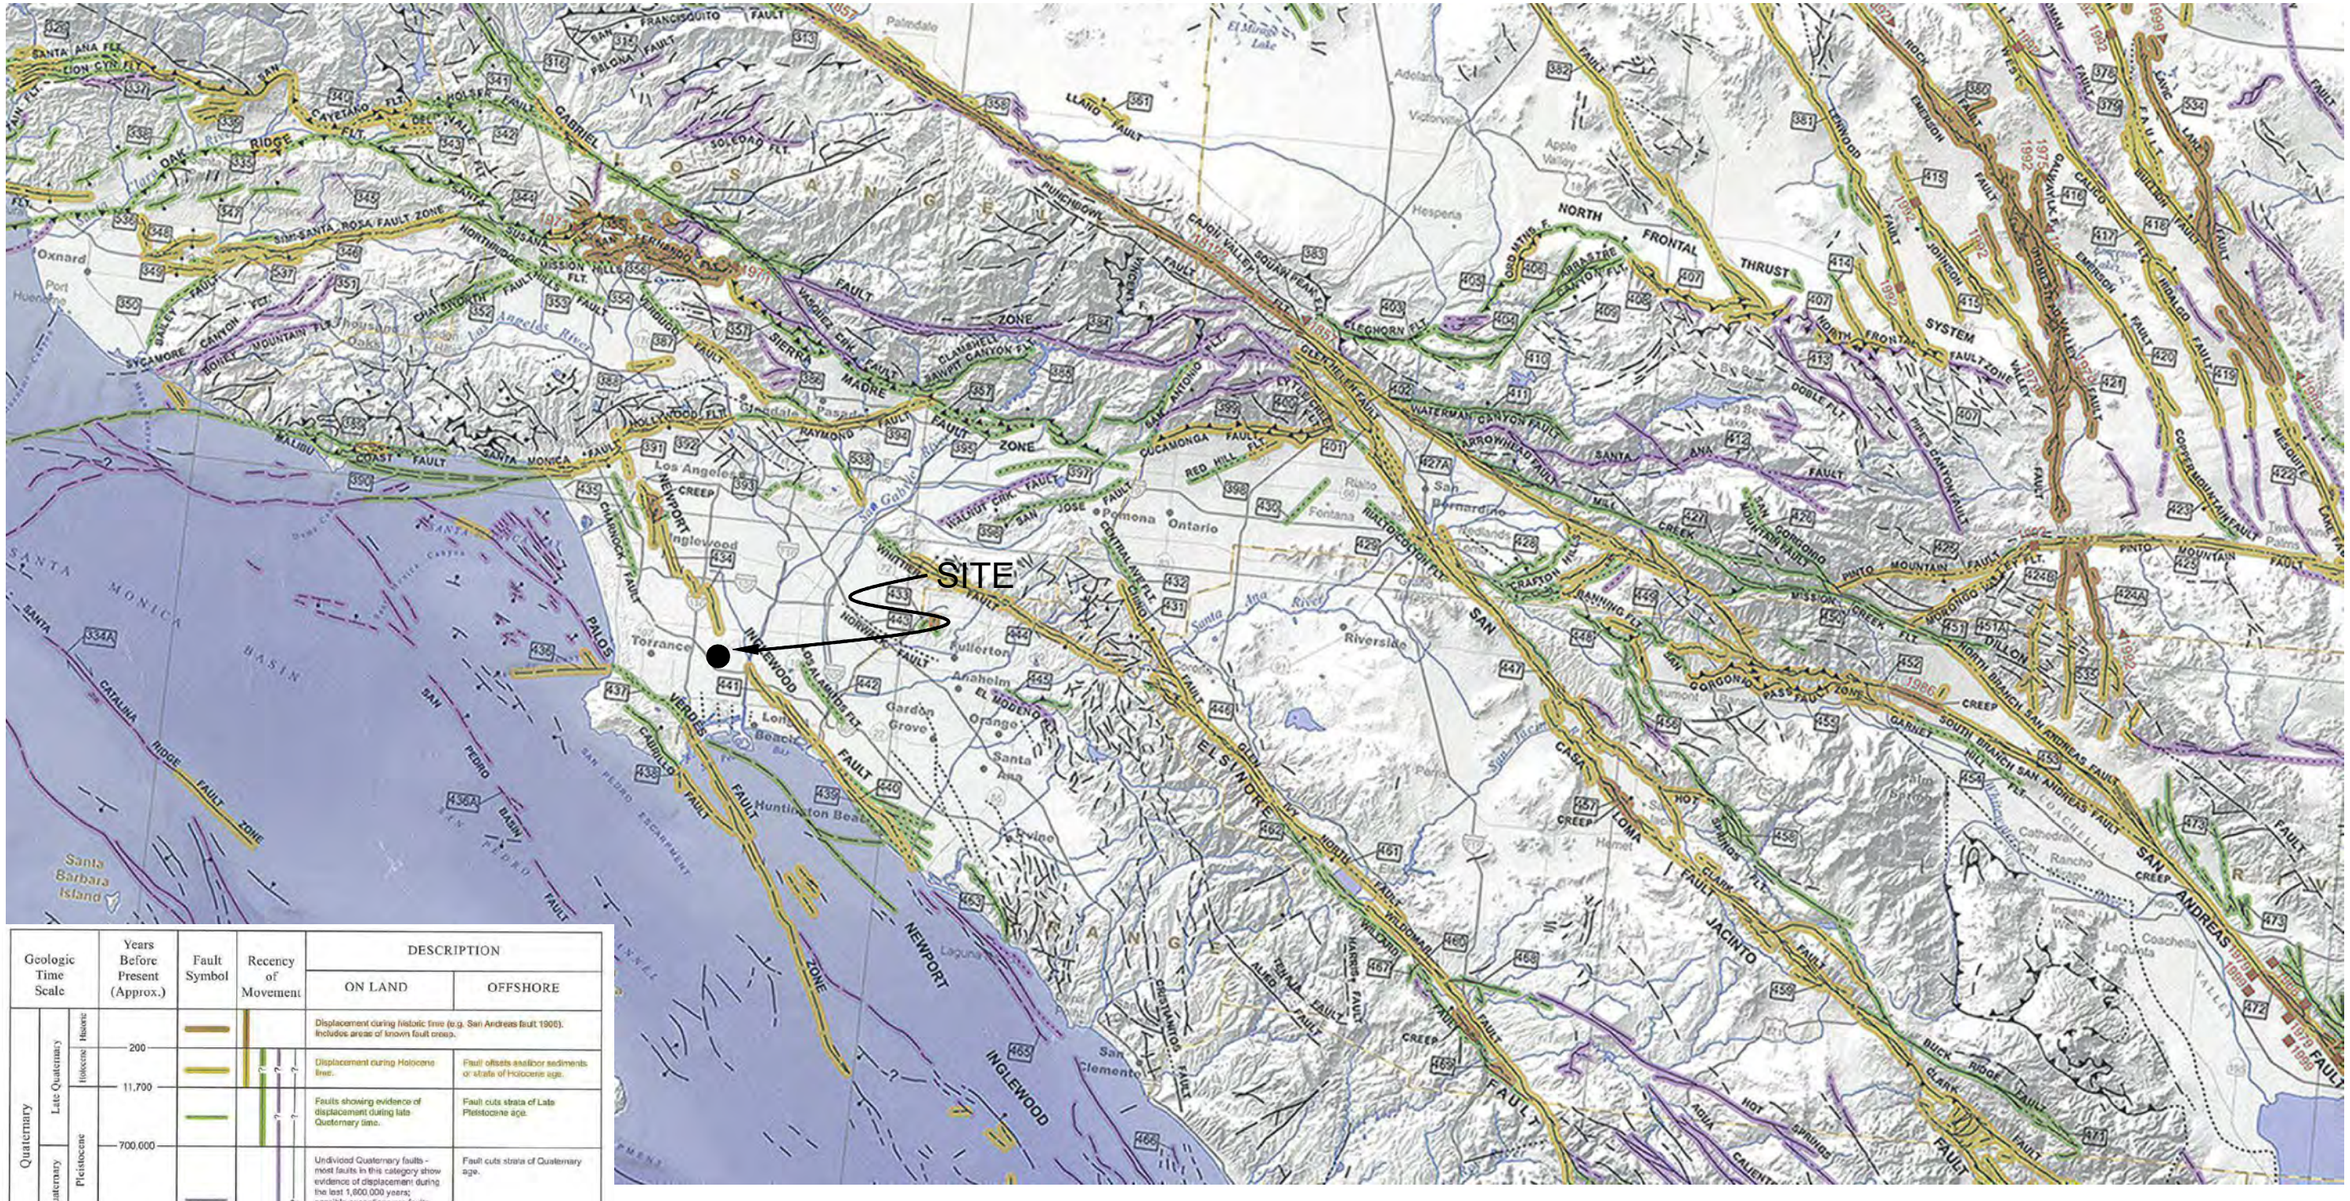
APRIL 2021	PROJECT NO. W1301-06-01	FIG. 2

Reference: Jennings, C.W. and Bryant, W. A., 2010, Fault Activity Map of California, California Geological Survey Geologic Data Map No. 6.



Geologic Time Scale			Years Before Present (Approx.)	Fault Symbol	Recency of Movement	DESCRIPTION: ON LAND	DESCRIPTION: OFFSHORE
Quaternary	Late Quaternary	Historic				Displacement during historic time (e.g. San Andreas fault 1906). Includes areas of known fault creep.	
		Holocene	200			Displacement during Holocene time.	Fault offsets seafloor sediments or strata of Holocene age.
			11,700			Faults showing evidence of displacement during late Quaternary time.	Fault cuts strata of Late Pleistocene age.
	Early Quaternary	Pleistocene	700,000			Undivided Quaternary faults - most faults in this category show evidence of displacement during the last 1,600,000 years; possible exceptions are faults which displace rocks of undifferentiated Plio-Pleistocene age.	Fault cuts strata of Quaternary age.
Pre-Quaternary			1,600,000*			Faults without recognized Quaternary displacement or showing evidence of no displacement during Quaternary time. Not necessarily inactive.	Fault cuts strata of Pliocene or older age.
			4.5 billion (Age of Earth)				

* Quaternary now recognized as extending to 2.6 Ma (Walker and Geissman, 2009). Quaternary faults in this map were established using the previous 1.6 Ma criterion.

APPENDIX A

APPENDIX A

FIELD INVESTIGATION

The site was explored on February 9, 2021 by drilling five 8-inch diameter borings using a truck-mounted hollow-stem auger drilling machine and advancing five cone penetrometer tests (CPTs). The borings were excavated to depths between approximately 20½ and 51 feet beneath the existing ground surface. The CPTs were advanced to depths of approximately 60 feet below existing ground surface. Representative and relatively undisturbed samples were obtained by driving a 4 inch, O. D., California Modified Sampler into the "undisturbed" soil mass with blows from a 140 pound hammer falling 30 inches. Bulk samples were also obtained. Standard Penetration Tests were performed in boring B3.

The soil conditions encountered in the borings were visually examined, classified and logged in general accordance with the Unified Soil Classification System (USCS). Logs of the borings are presented on Figures A1 through A5. The CPT data is presented as Figures A6 through A10. The logs depict the soil and geologic conditions encountered and the depth at which samples were obtained. The logs also include our interpretation of the conditions between sampling intervals. Therefore, the logs contain both observed and interpreted data. We determined the lines designating the interface between soil materials on the logs using visual observations, penetration rates, excavation characteristics and other factors. The transition between materials may be abrupt or gradual. Where applicable, the boring logs were revised based on subsequent laboratory testing. The approximate locations of the borings and CPTs are depicted on the Site Plan (see Figure 2)

APPENDIX B

APPENDIX B

LABORATORY TESTING

Laboratory tests were performed in accordance with generally accepted test methods of the "American Society for Testing and Materials (ASTM)", or other suggested procedures. Selected samples were tested for direct shear strength, consolidation, plasticity indices, grain size, moisture density relationship, expansion characteristics, corrosivity and in-place dry density and moisture content. The results of the laboratory tests are summarized in Figures B1 through B23. The in-place dry density and moisture content of the samples tested are presented on the boring logs, Appendix A.

CPT LIQUEFACTION ANALYSIS

TABLE OF CONTENTS

CPT-1 results

Summary data report	1
Transition layer aglorithm summary report	8
Transition layer aglorithm data report	9
Input field data	10
Cyclic stress resistance results	30
Cyclic resistance ratio results	50
Liquefaction potential index data	70
Vertical settlements summary report	80
Lateral displacements data report	81
Strength loss data report	98

CPT-2 results

Summary data report	118
Transition layer aglorithm summary report	125
Transition layer aglorithm data report	126
Input field data	127
Cyclic stress resistance results	147
Cyclic resistance ratio results	167
Liquefaction potential index data	187
Vertical settlements summary report	197
Lateral displacements data report	198
Strength loss data report	215

CPT-3 results

Summary data report	235
Transition layer aglorithm summary report	242
Transition layer aglorithm data report	243
Input field data	244
Cyclic stress resistance results	264
Cyclic resistance ratio results	284
Liquefaction potential index data	304
Vertical settlements summary report	314
Lateral displacements data report	315
Strength loss data report	332

CPT-4 results

Summary data report	352
Transition layer aglorithm summary report	359
Transition layer aglorithm data report	360
Input field data	361
Cyclic stress resistance results	381
Cyclic resistance ratio results	401
Liquefaction potential index data	421
Vertical settlements summary report	431
Lateral displacements data report	432
Strength loss data report	449

CPT-5 results

Summary data report	469
Transition layer aglorithm summary report	476
Transition layer aglorithm data report	477
Input field data	478
Cyclic stress resistance results	498
Cyclic resistance ratio results	518

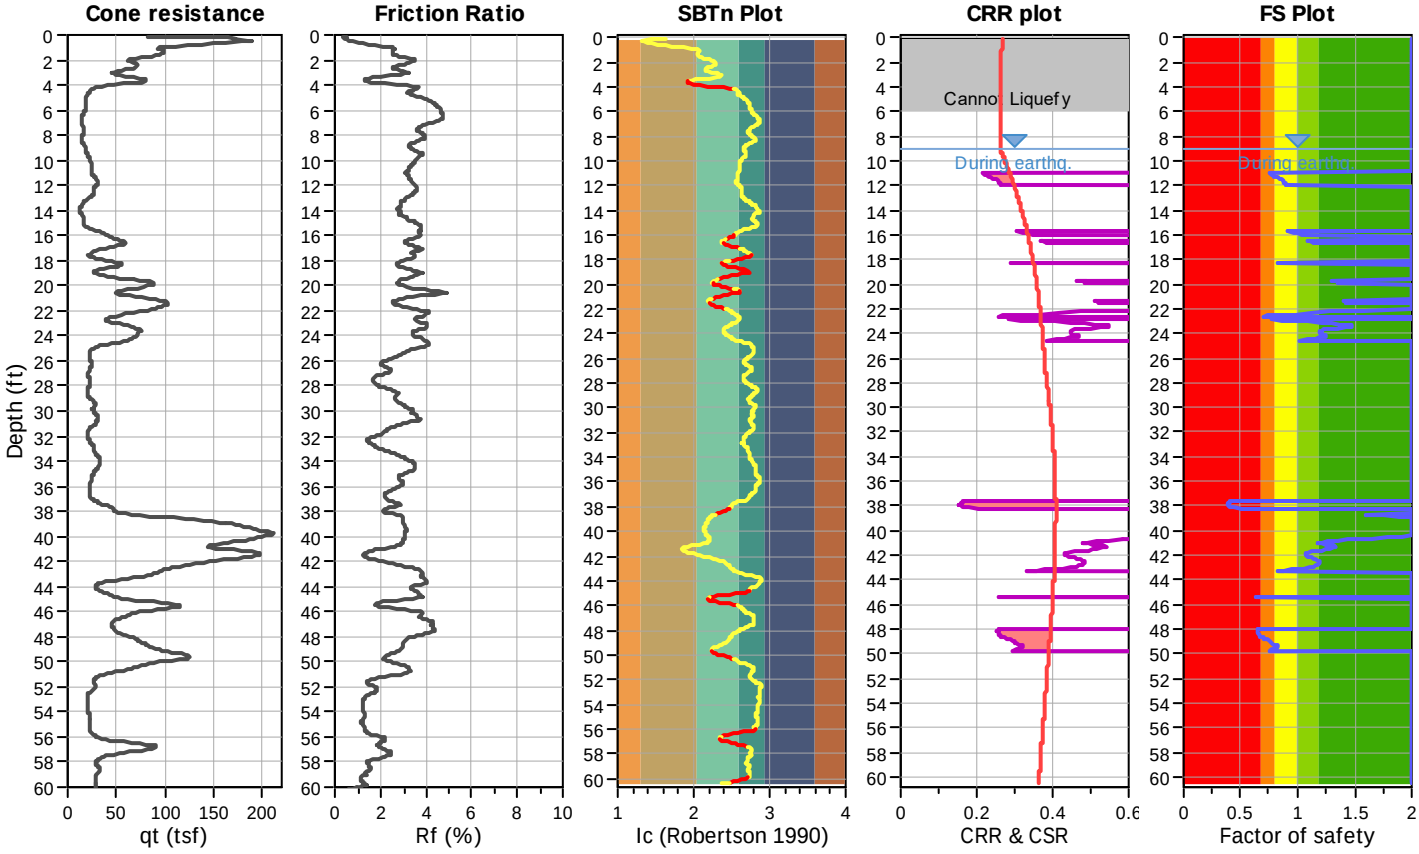
LIQUEFACTION ANALYSIS REPORT

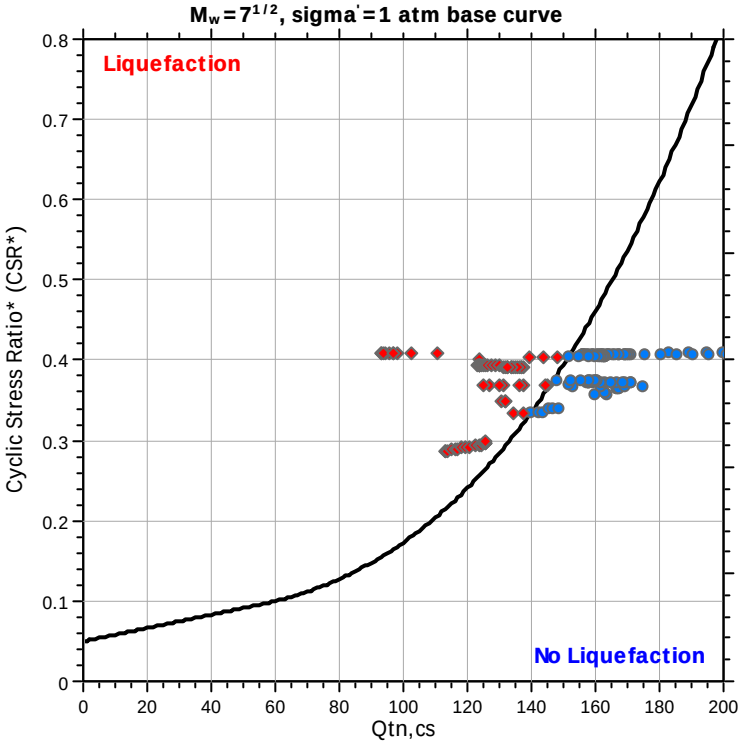
Project title : W1301-06-01 **Location : Perry Street**

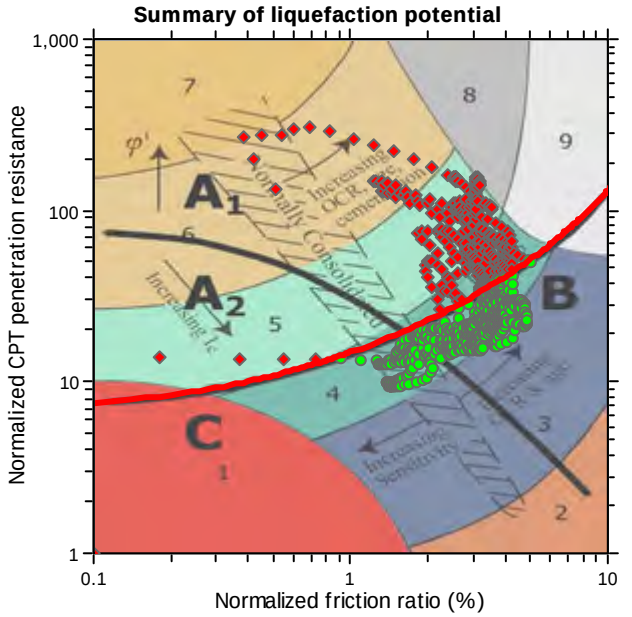
CPT file : CPT-1

Input parameters and analysis data

Analysis method:	NCEER (1998)	G.W.T. (in-situ):	12.00 ft	Use fill:	No	Clay like behavior applied:	Sands only
Fines correction method:	NCEER (1998)	G.W.T. (earthq.):	9.00 ft	Fill height:	N/A	Limit depth applied:	Yes
Points to test:	Based on Ic value	Average results interval:	.	Fill weight:	N/A	Limit depth:	50.00 ft
Earthquake magnitude M_w:	6.68	Ic cut-off value:	2.60	Trans. detect. applied:	Yes	MSF method:	Method based
Peak ground acceleration:	0.55	Unit weight calculation:	Based on SBT	K_σ applied:	Yes		

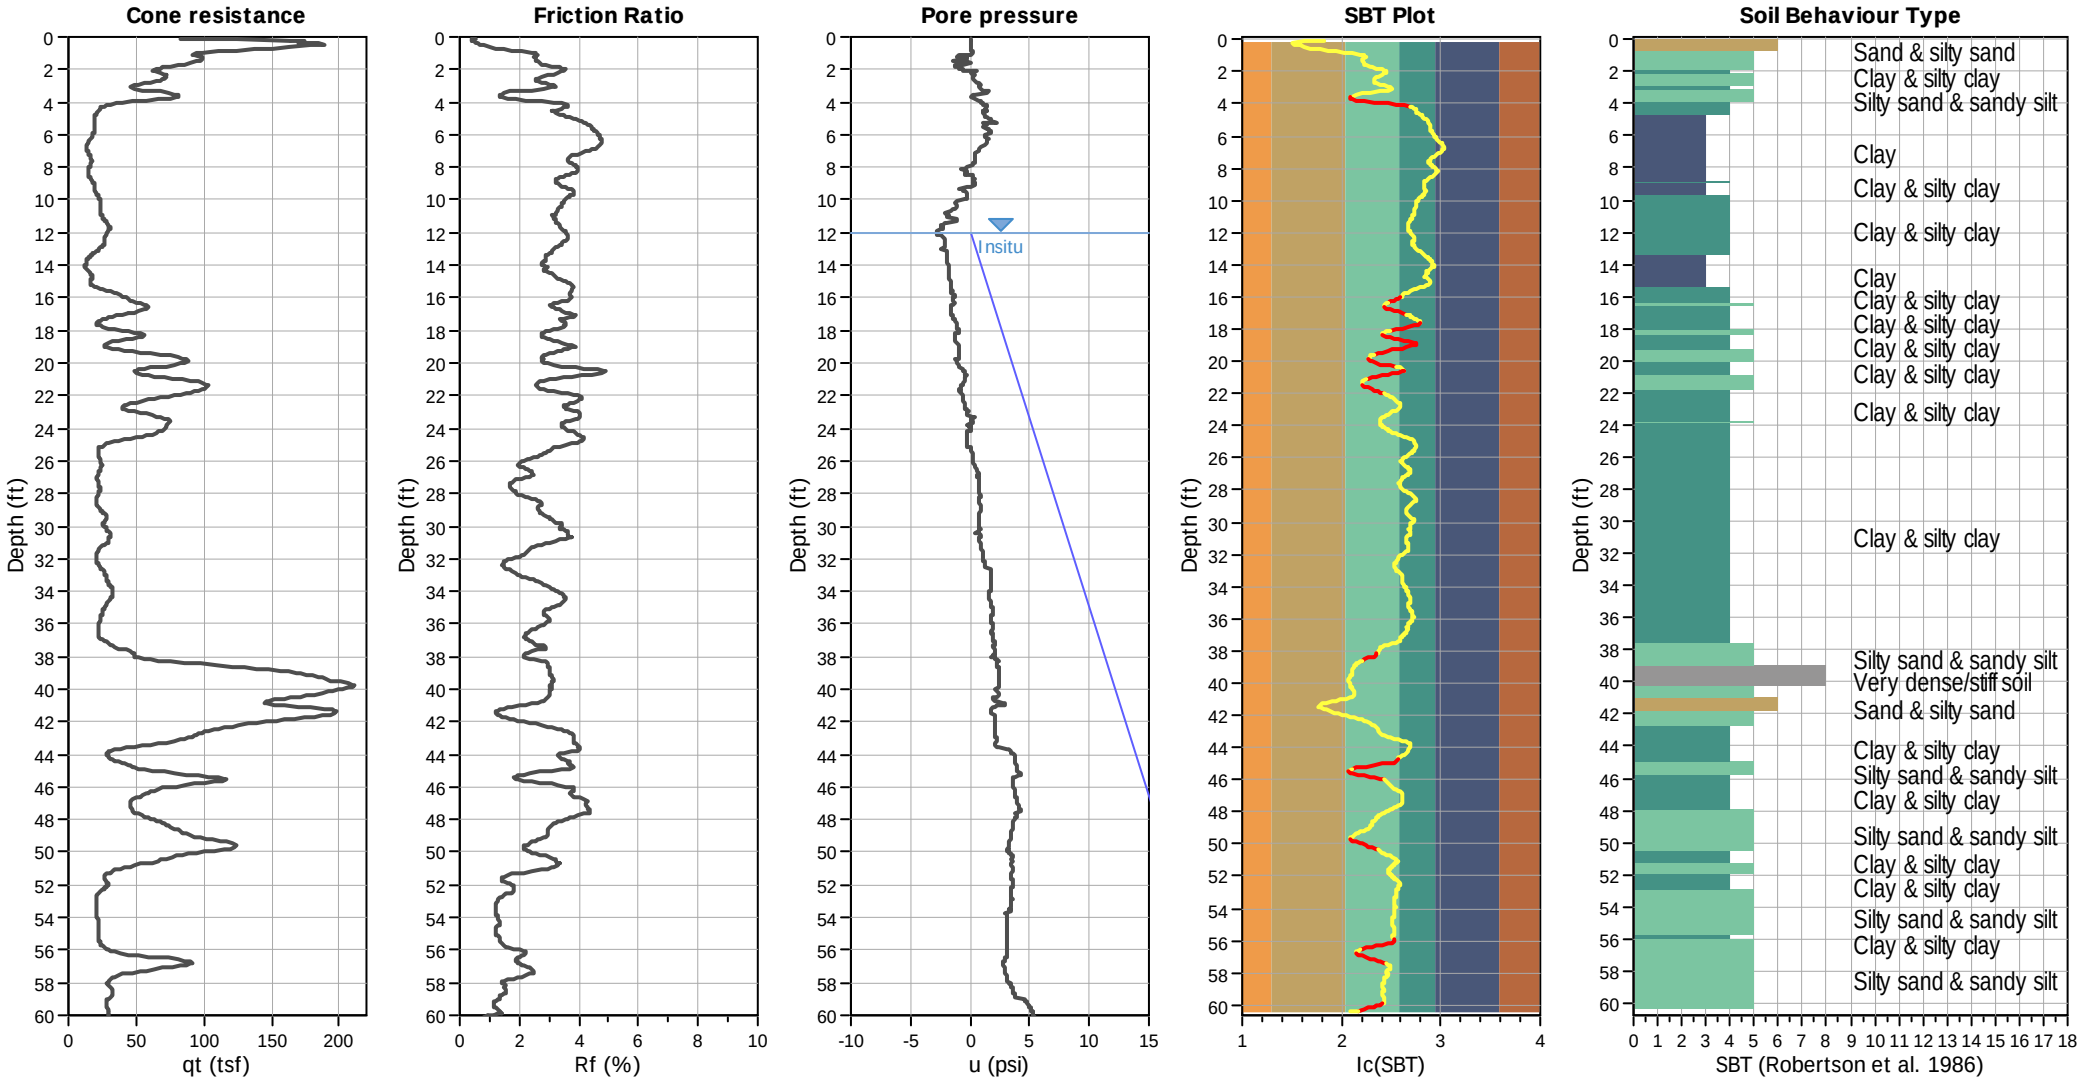






Zone A_1: Cyclic liquefaction likely depending on size and duration of cyclic loading
Zone A_2: Cyclic liquefaction and strength loss likely depending on loading and ground geometry
Zone B: Liquefaction and post-earthquake strength loss unlikely, check cyclic softening
Zone C: Cyclic liquefaction and strength loss possible depending on soil plasticity, brittleness/sensitivity, strain to peak undrained strength and ground geometry

CPT basic interpretation plots



Input parameters and analysis data

Analysis method:	NCEER (1998)	Depth to water table (erthq.):	9.00 ft	Fill weight:	N/A
Fines correction method:	NCEER (1998)	Average results interval:	.	Transition detect. applied:	Yes
Points to test:	Based on Ic value	Ic cut-off value:	2.60	K_σ applied:	Yes
Earthquake magnitude M_w:	6.68	Unit weight calculation:	Based on SBT	Clay like behavior applied:	Sands only
Peak ground acceleration:	0.55	Use fill:	No	Limit depth applied:	Yes
Depth to water table (insitu):	12.00 ft	Fill height:	N/A	Limit depth:	50.00 ft

SBT legend

1. Sensitive fine grained
2. Organic material

Peak ground acceleration:	0.55	Use fill:	No	Limit depth applied:	Yes
Depth to water table (insitu):	12.00 ft	Fill height:	N/A	Limit depth:	50.00 ft

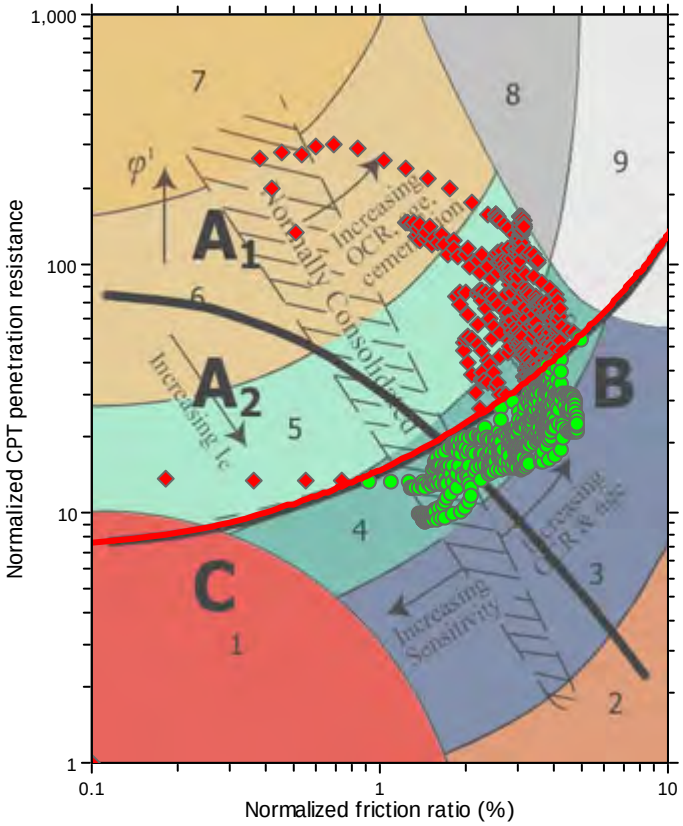
F.S. color scheme

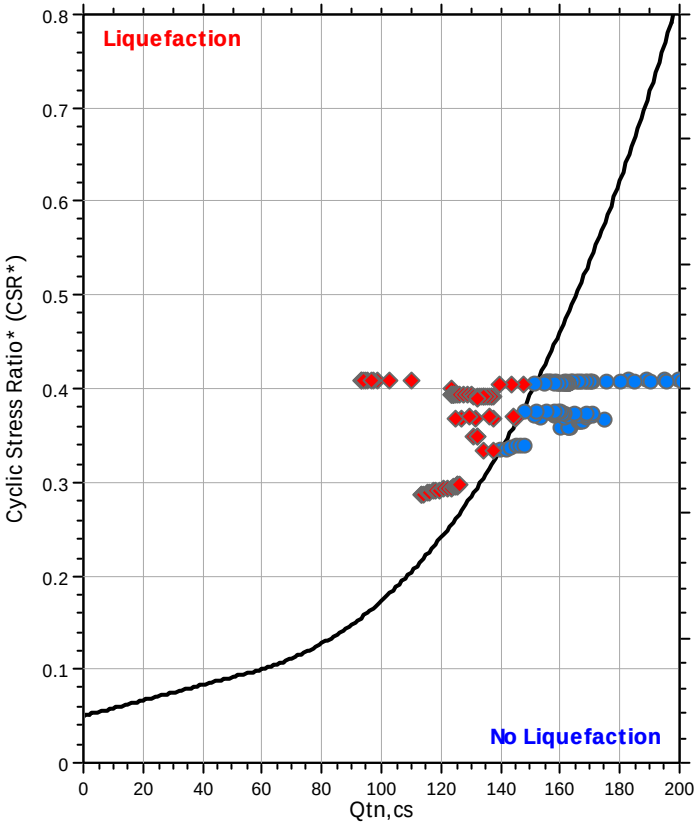
- Almost certain it will liquefy
- Very likely to liquefy
- Liquefaction and no liq. are equally likely
- Unlike to liquefy
- Almost certain it will not liquefy

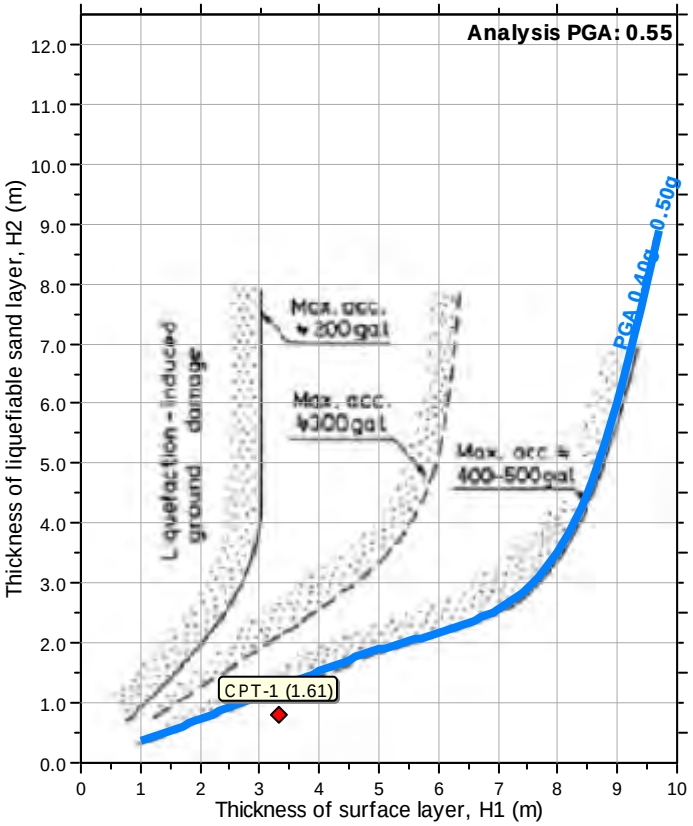
LPI color scheme

- Very high risk
- High risk
- Low risk

Liquefaction analysis summary plots







Input parameters and analysis data

Analysis method:	NCEER (1998)	Depth to water table (erthq.):	9.00 ft	Fill weight:	N/A

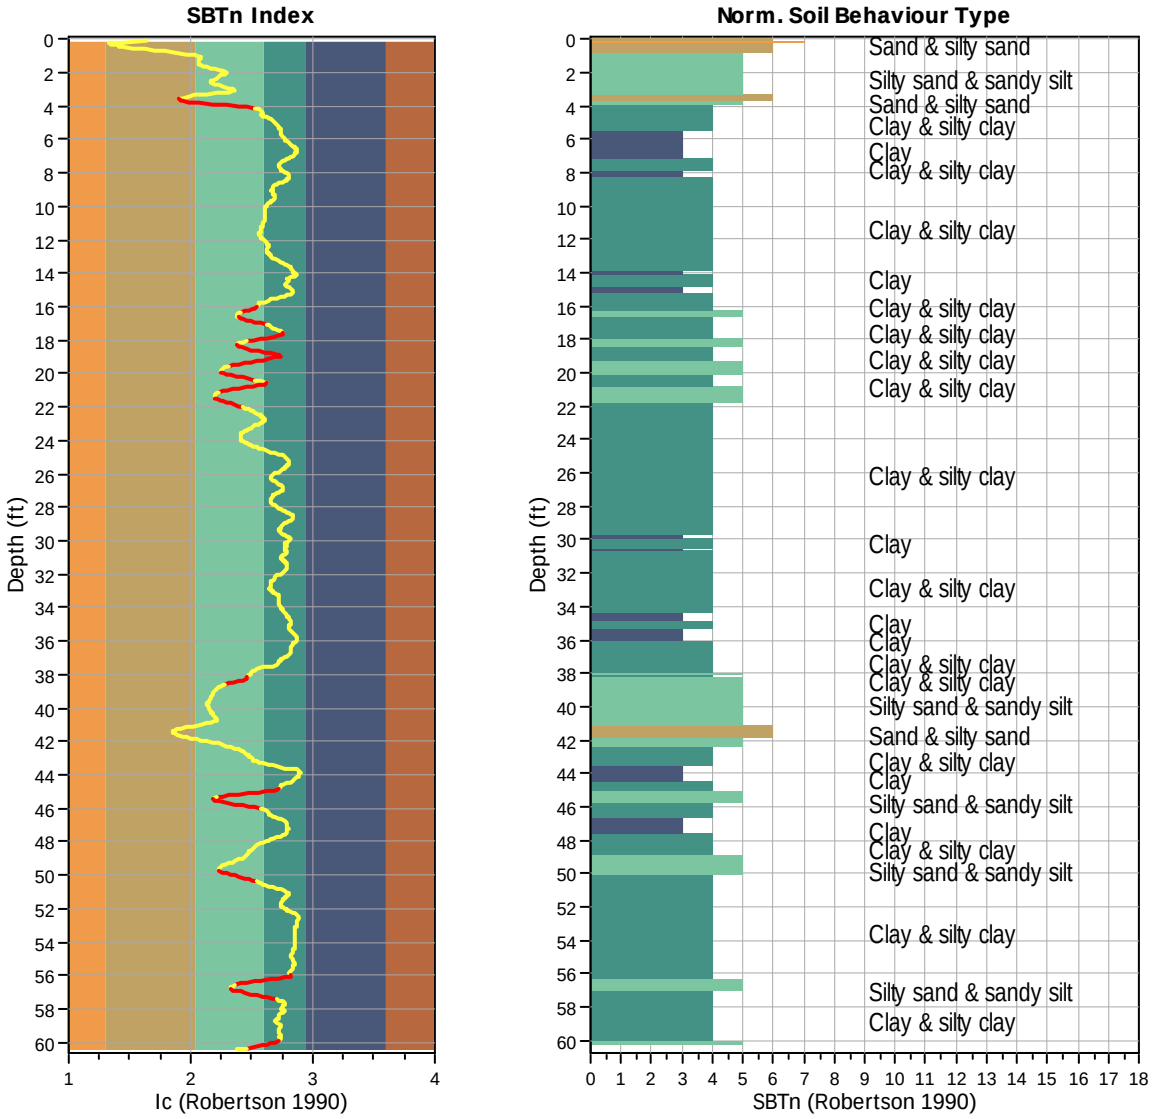
TRANSITION LAYER DETECTION ALGORITHM REPORT
Summary Details & Plots

Short description

The software will delete data when the cone is in transition from either clay to sand or vise-versa. To do this the software requires a range of I_c values over which the transition will be defined (typically somewhere between 1.80 < I_c < 3.0) and a rate of change of I_c. Transitions typically occur when the rate of change of I_c is fast (i.e. delta I_c is small).

The SBT_n plot below, displays in red the detected transition layers based on the parameters listed below the graphs.



Transition layer algorithm properties

I_c minimum check value:	1.70
I_c maximum check value:	3.00
I_c change ratio value:	0.0250
Minimum number of points in layer:	4

General statistics

Total points in CPT file:	922
Total points excluded:	144
Exclusion percentage:	15.62%
Number of layers detected:	16

Transition layer No	Number of points	Depth	SBT_n number	SBT_n description
Transition layer 1	10	Start depth: 3.64 (ft)	6	Sand & silty sand
		End depth: 4.20 (ft)	4	Clay & silty clay
Transition layer 2	6	Start depth: 16.10 (ft)	4	Clay & silty clay
		End depth: 16.41 (ft)	5	Silty sand & sandy silt
Transition layer 3	8	Start depth: 16.70 (ft)	5	Silty sand & sandy silt
		End depth: 17.14 (ft)	4	Clay & silty clay
Transition layer 4	8	Start depth: 17.67 (ft)	4	Clay & silty clay
		End depth: 18.12 (ft)	5	Silty sand & sandy silt
Transition layer 5	9	Start depth: 18.40 (ft)	5	Silty sand & sandy silt
		End depth: 18.91 (ft)	4	Clay & silty clay
Transition layer 6	11	Start depth: 18.98 (ft)	4	Clay & silty clay
		End depth: 19.63 (ft)	5	Silty sand & sandy silt
Transition layer 7	8	Start depth: 19.99 (ft)	5	Silty sand & sandy silt
		End depth: 20.42 (ft)	4	Clay & silty clay
Transition layer 8	10	Start depth: 20.62 (ft)	4	Clay & silty clay
		End depth: 21.21 (ft)	5	Silty sand & sandy silt
Transition layer 9	9	Start depth: 21.56 (ft)	5	Silty sand & sandy silt
		End depth: 22.05 (ft)	4	Clay & silty clay
Transition layer 10	7	Start depth: 38.26 (ft)	4	Clay & silty clay
		End depth: 38.65 (ft)	5	Silty sand & sandy silt
Transition layer 11	10	Start depth: 44.84 (ft)	4	Clay & silty clay
		End depth: 45.43 (ft)	5	Silty sand & sandy silt
Transition layer 12	9	Start depth: 45.58 (ft)	5	Silty sand & sandy silt
		End depth: 46.07 (ft)	4	Clay & silty clay
Transition layer 13	11	Start depth: 49.77 (ft)	5	Silty sand & sandy silt
		End depth: 50.42 (ft)	4	Clay & silty clay
Transition layer 14	10	Start depth: 56.05 (ft)	4	Clay & silty clay
		End depth: 56.65 (ft)	5	Silty sand & sandy silt
Transition layer 15	11	Start depth: 56.87 (ft)	5	Silty sand & sandy silt
		End depth: 57.48 (ft)	4	Clay & silty clay
Transition layer 16	7	Start depth: 60.01 (ft)	4	Clay & silty clay
		End depth: 60.40 (ft)	5	Silty sand & sandy silt

Start depth: Depth where the transition layer begins
End depth: Depth where the transition layer ends

Abbreviations

Depth: Depth from free surface, at which CPT was performed (ft)
q_c: Measured cone resistance (tsf)
f_s: Sleeve friction resistance (tsf)
u: Pore pressure (tsf)
Fines content: Percentage of fines in soil (%)
Unit weight: Bulk soil unit weight (pcf)

Abbreviations

Depth: Depth from free surface, at which CPT was performed (ft)
σ_v: Total overburden pressure at test point (tsf)
u_0: Water pressure at test point (tsf)
σ_v': Effective overburden pressure based on GWT during earthquake (tsf)
r_d: Nonlinear shear mass factor
CSR: Cyclic Stress Ratio
MSF: Magnitude Scaling Factor
CSR_{eq}: CSR adjusted for M=7.5
K_σ: Effective overburden stress factor
CSR^*: CSR fully adjusted

Abbreviations

Depth: Depth from free surface, at which CPT was performed (ft)
q_t: Total cone resistance
I_c: Soil behavior type index
Fr: Normalized friction ratio (%)
n: Stress exponent
Q_{tn}: Normalized cone resistance
K_c: Cone resistance correction factor due to fines
$Q_{tn,cs}$: Normalized and adjusted cone resistance
$CRR_{7.5}$: Cyclic resistance ratio for M_w=7.5
FS: Factor of safety against soil liquefaction

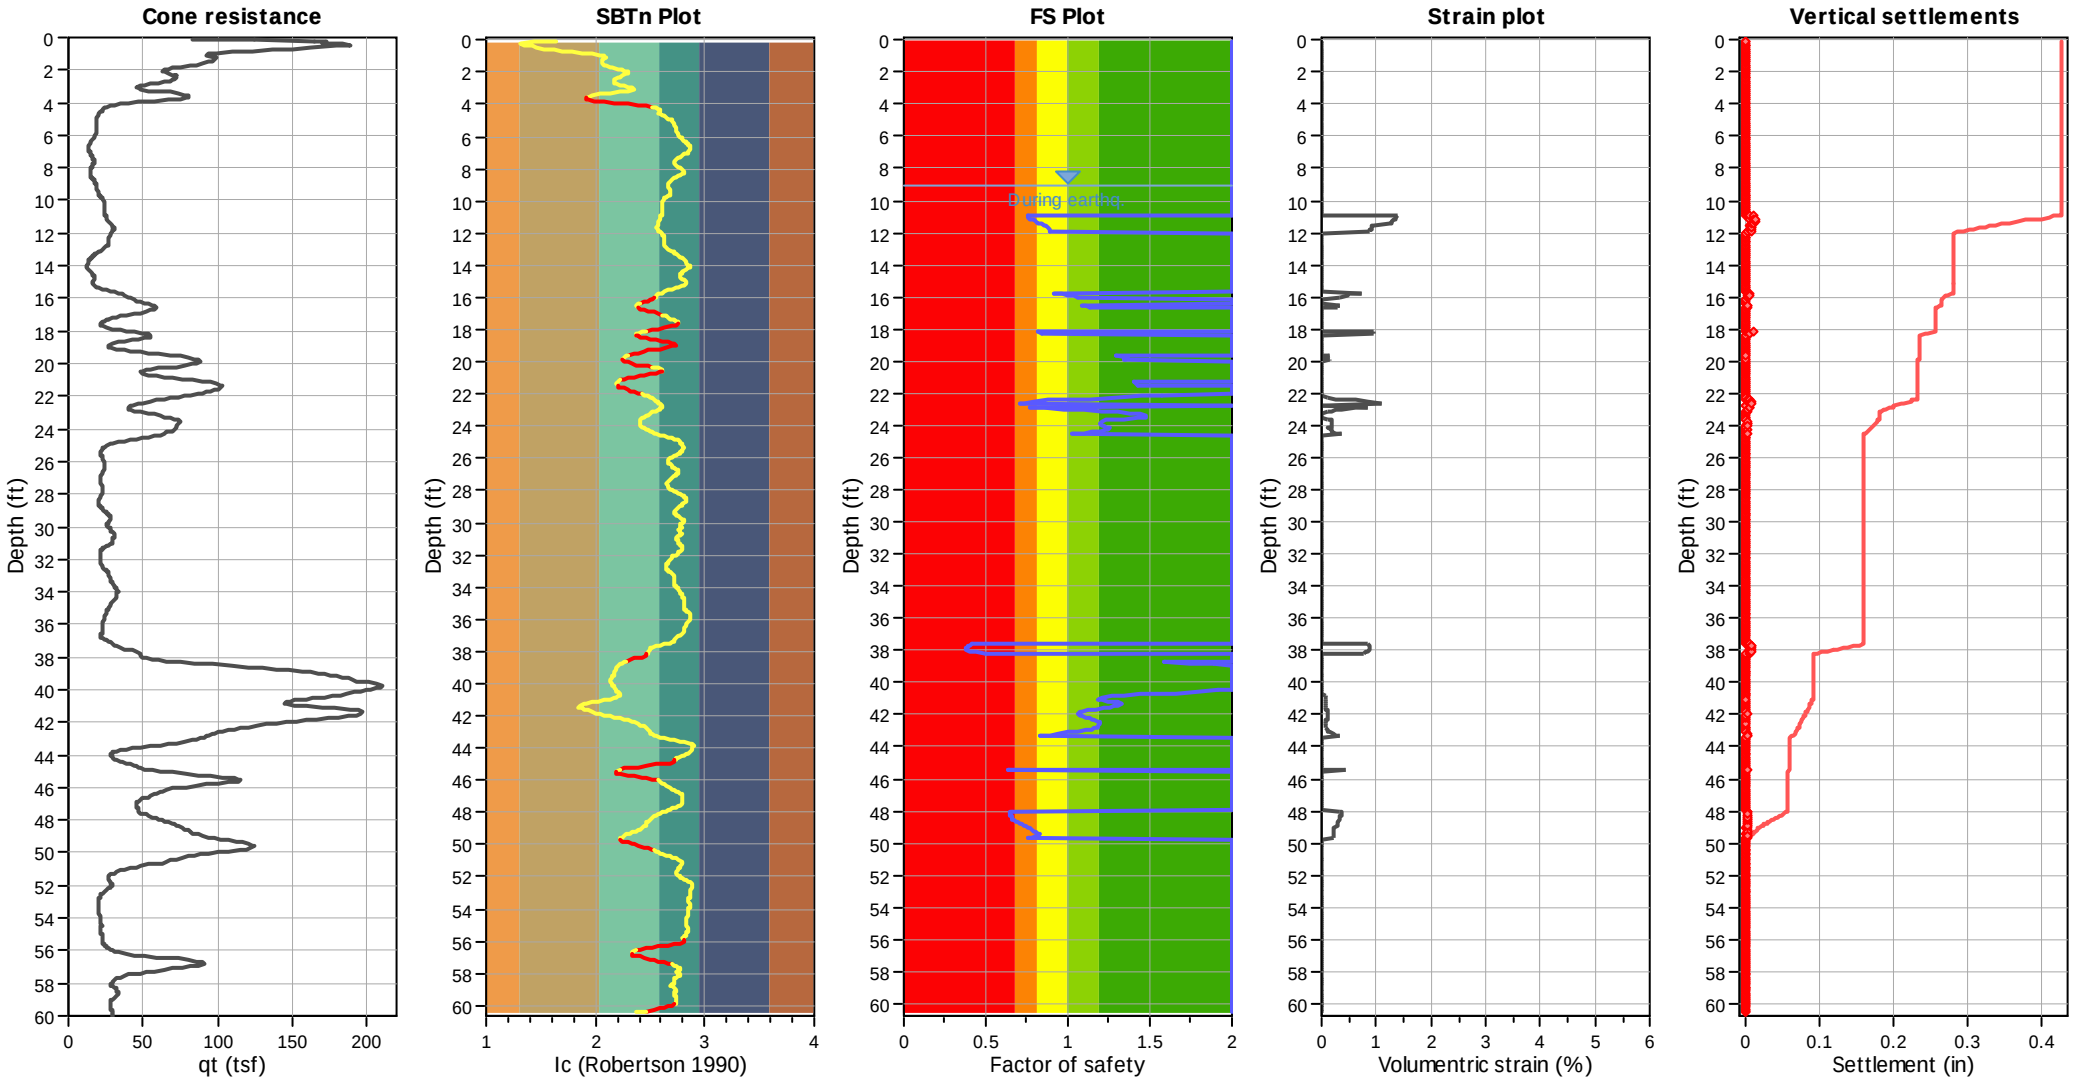
Overall liquefaction potential: 1.61

LPI = 0.00 - Liquefaction risk very low
LPI between 0.00 and 5.00 - Liquefaction risk low
LPI between 5.00 and 15.00 - Liquefaction risk high
LPI > 15.00 - Liquefaction risk very high

Abbreviations

FS: Calculated factor of safety for test point
F_L: 1 - FS
w_z: Function value of the extend of soil liquefaction according to depth
d_z: Layer thickness (ft)
LPI: Liquefaction potential index value for test point

Estimation of post-earthquake settlements



Abbreviations

q_t:	Total cone resistance (cone resistance q_c corrected for pore water effects)
I_c:	Soil Behaviour Type Index
FS:	Calculated Factor of Safety against liquefaction
Volumentric strain:	Post-liquefaction volumentric strain

Total estimated displacement: 10.07

Abbreviations

q_t: Total cone resistance
Q_{tn}: Adjusted cone resistance to an effective overburden stress of 1 atm
R_f: Friction ration
$Q_{tn,cs}$: Adjusted and corrected cone resistance due to fines
FS: Calculated factor of safety against liquefaction
D_r: Calculated relative density
$Gamma_{max}$: Calculated maximum cyclic shear strain
Lat. disp.: Lateral displacement

Abbreviations

q_t: Total cone resistance
K_c: Cone resistance correction factor due to fines
$Q_{tn,cs}$: Adjusted and corrected cone resistance due to fines
I_c: Soil behavior type index
$S_{u(liq)}/\sigma'_v$: Calculated liquefied undrained strength ratio
$S_{u(peak)}/\sigma'_v$: Calculated peak undrained strength ratio

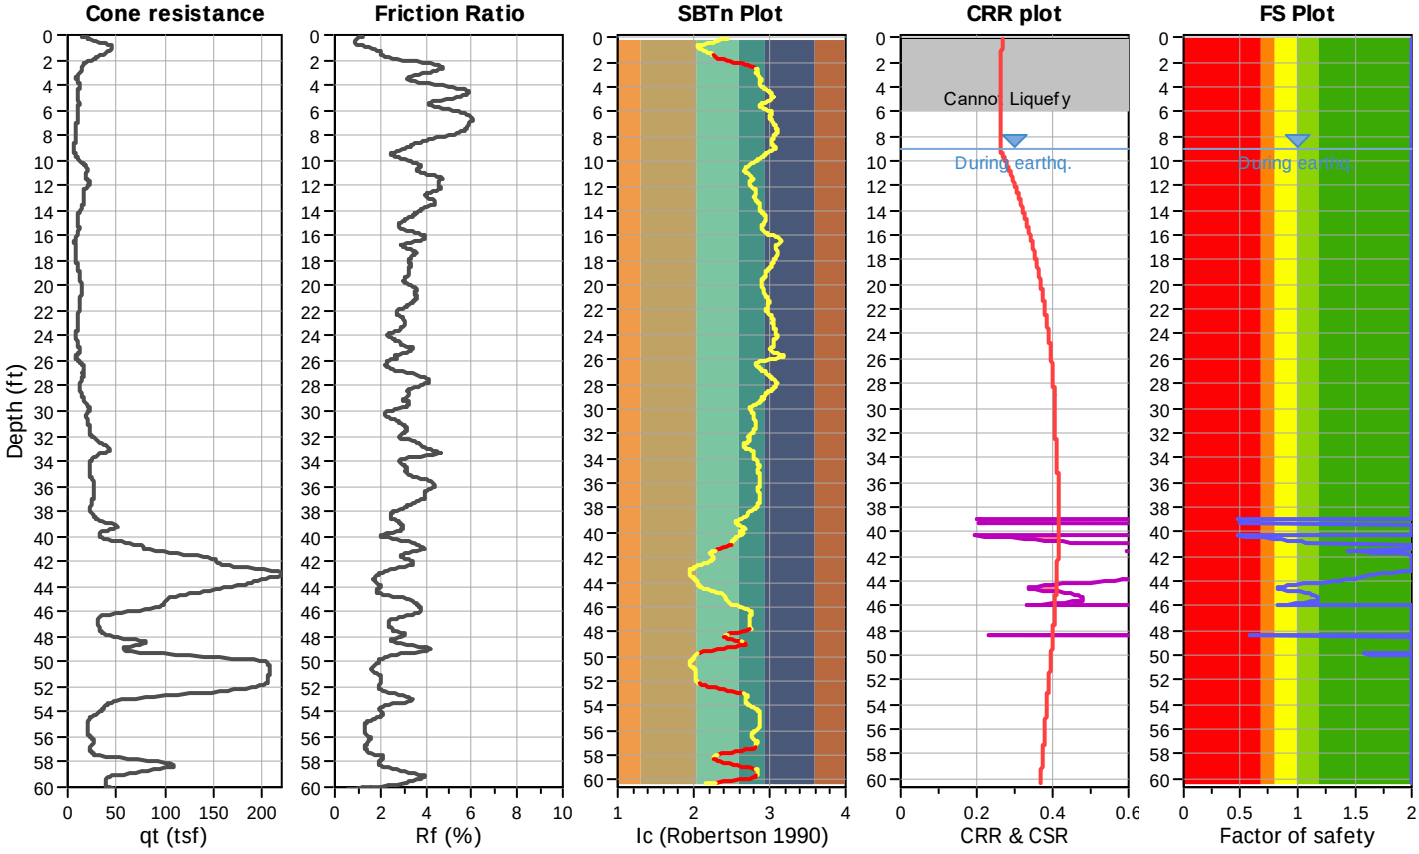
LIQUEFACTION ANALYSIS REPORT

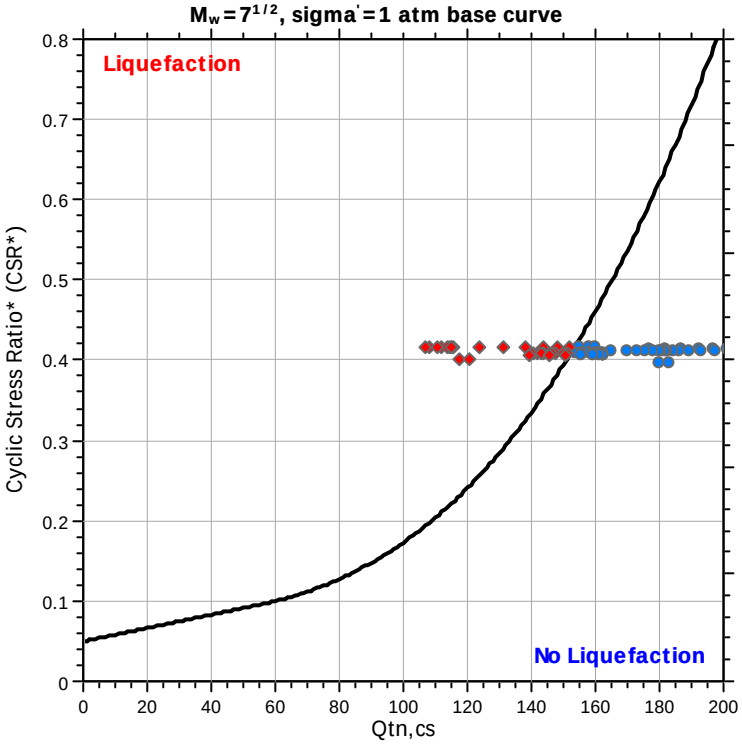
Project title : W1301-06-01 **Location : Perry Street**

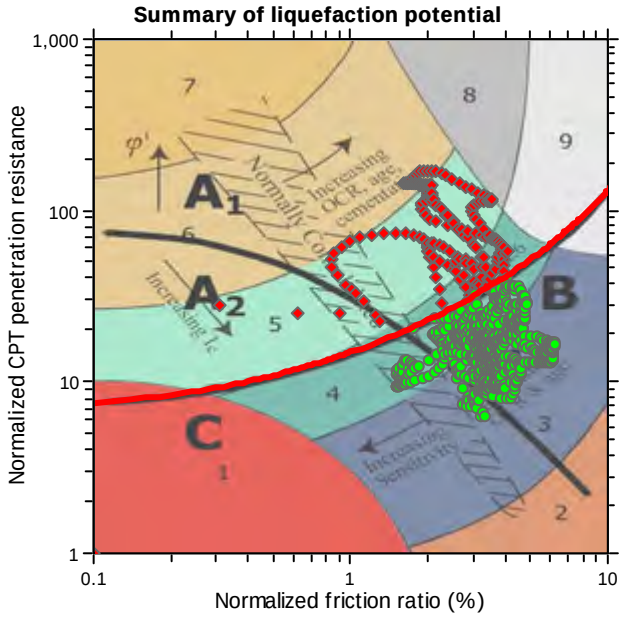
CPT file : CPT-2

Input parameters and analysis data

Analysis method:	NCEER (1998)	G.W.T. (in-situ):	12.00 ft	Use fill:	No	Clay like behavior applied:	Sands only
Fines correction method:	NCEER (1998)	G.W.T. (earthq.):	9.00 ft	Fill height:	N/A	Limit depth applied:	Yes
Points to test:	Based on Ic value	Average results interval:	.	Fill weight:	N/A	Limit depth:	50.00 ft
Earthquake magnitude M_w:	6.68	Ic cut-off value:	2.60	Trans. detect. applied:	Yes	MSF method:	Method based
Peak ground acceleration:	0.55	Unit weight calculation:	Based on SBT	K_σ applied:	Yes		







Zone A_1: Cyclic liquefaction likely depending on size and duration of cyclic loading
Zone A_2: Cyclic liquefaction and strength loss likely depending on loading and ground geometry
Zone B: Liquefaction and post-earthquake strength loss unlikely, check cyclic softening
Zone C: Cyclic liquefaction and strength loss possible depending on soil plasticity, brittleness/sensitivity, strain to peak undrained strength and ground geometry

F.S. color scheme

- Almost certain it will liquefy
- Very likely to liquefy
- Liquefaction and no liq. are equally likely
- Unlike to liquefy
- Almost certain it will not liquefy

LPI color scheme

- Very high risk
- High risk
- Low risk

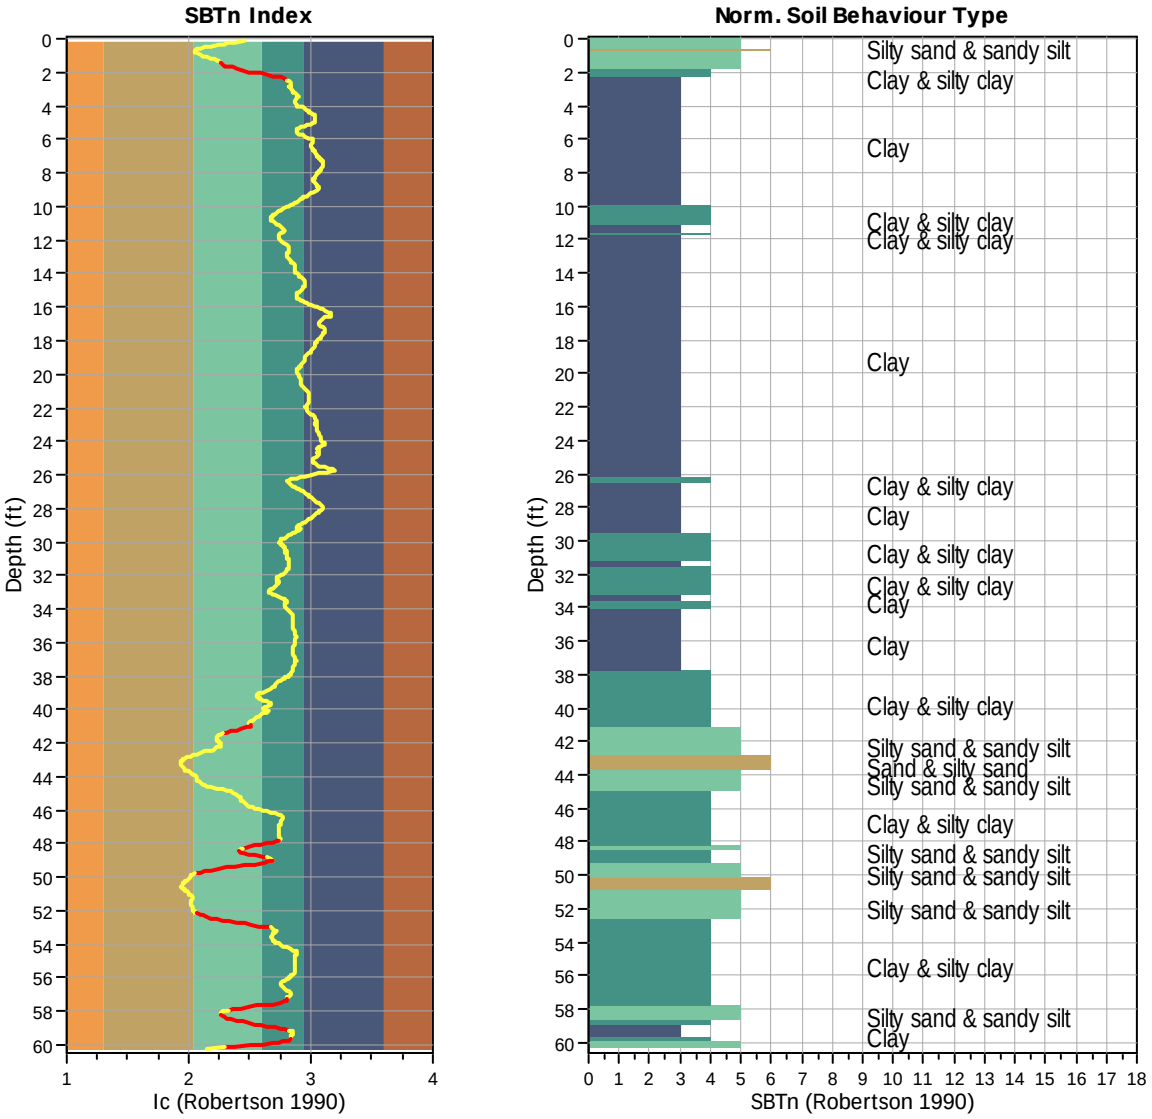
TRANSITION LAYER DETECTION ALGORITHM REPORT
Summary Details & Plots

Short description

The software will delete data when the cone is in transition from either clay to sand or vise-versa. To do this the software requires a range of I_c values over which the transition will be defined (typically somewhere between 1.80 < I_c < 3.0) and a rate of change of I_c. Transitions typically occur when the rate of change of I_c is fast (i.e. delta I_c is small).

The SBT_n plot below, displays in red the detected transition layers based on the parameters listed below the graphs.



Transition layer algorithm properties

I_c minimum check value:	1.70
I_c maximum check value:	3.00
I_c change ratio value:	0.0250
Minimum number of points in layer:	4

General statistics

Total points in CPT file:	920
Total points excluded:	100
Exclusion percentage:	10.87%
Number of layers detected:	9

Transition layer No	Number of points	Depth	SBT_n number	SBT_n description
Transition layer 1	16	Start depth: 1.55 (ft)	5	Silty sand & sandy silt
		End depth: 2.50 (ft)	3	Clay
Transition layer 2	8	Start depth: 41.03 (ft)	4	Clay & silty clay
		End depth: 41.48 (ft)	5	Silty sand & sandy silt
Transition layer 3	8	Start depth: 47.86 (ft)	4	Clay & silty clay
		End depth: 48.34 (ft)	5	Silty sand & sandy silt
Transition layer 4	7	Start depth: 48.51 (ft)	5	Silty sand & sandy silt
		End depth: 48.90 (ft)	4	Clay & silty clay
Transition layer 5	13	Start depth: 49.03 (ft)	4	Clay & silty clay
		End depth: 49.83 (ft)	5	Silty sand & sandy silt
Transition layer 6	14	Start depth: 52.26 (ft)	5	Silty sand & sandy silt
		End depth: 53.10 (ft)	4	Clay & silty clay
Transition layer 7	11	Start depth: 57.38 (ft)	4	Clay & silty clay
		End depth: 58.02 (ft)	5	Silty sand & sandy silt
Transition layer 8	14	Start depth: 58.37 (ft)	5	Silty sand & sandy silt
		End depth: 59.19 (ft)	3	Clay
Transition layer 9	9	Start depth: 59.74 (ft)	3	Clay
		End depth: 60.25 (ft)	5	Silty sand & sandy silt

Start depth: Depth where the transition layer begins
End depth: Depth where the transition layer ends

Abbreviations

Depth: Depth from free surface, at which CPT was performed (ft)
q_c: Measured cone resistance (tsf)
f_s: Sleeve friction resistance (tsf)
u: Pore pressure (tsf)
Fines content: Percentage of fines in soil (%)
Unit weight: Bulk soil unit weight (pcf)

:: Cyclic Stress Ratio fully adjusted (CSR*) calculation data ::

Abbreviations

Depth: Depth from free surface, at which CPT was performed (ft)
σ_v: Total overburden pressure at test point (tsf)
u_0: Water pressure at test point (tsf)
σ_v': Effective overburden pressure based on GWT during earthquake (tsf)
r_d: Nonlinear shear mass factor
CSR: Cyclic Stress Ratio
MSF: Magnitude Scaling Factor
CSR_{eq}: CSR adjusted for M=7.5
K_σ: Effective overburden stress factor
CSR^*: CSR fully adjusted

Abbreviations

Depth: Depth from free surface, at which CPT was performed (ft)
q_t: Total cone resistance
I_c: Soil behavior type index
Fr: Normalized friction ratio (%)
n: Stress exponent
Q_{tn}: Normalized cone resistance
K_c: Cone resistance correction factor due to fines
$Q_{tn,cs}$: Normalized and adjusted cone resistance
$CRR_{7.5}$: Cyclic resistance ratio for M_w=7.5
FS: Factor of safety against soil liquefaction

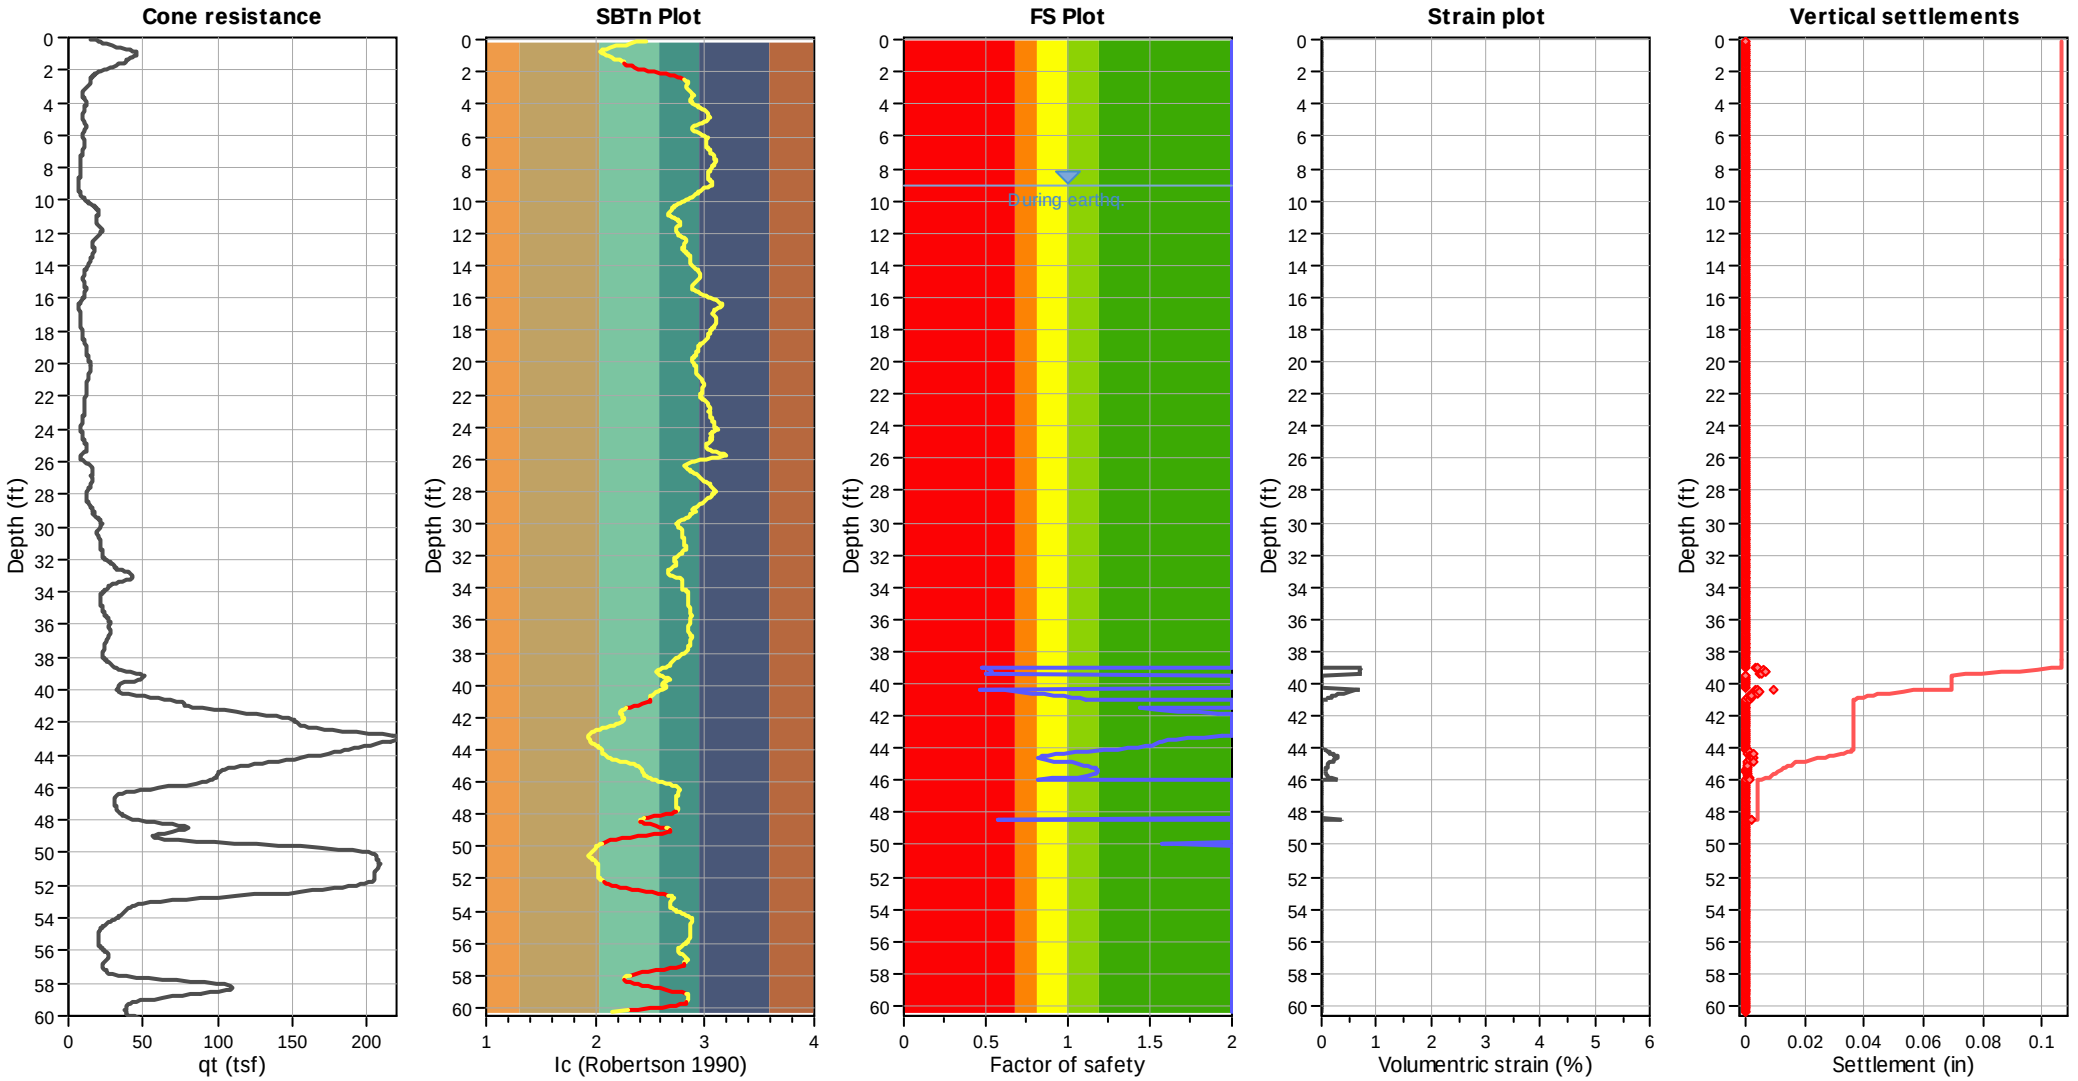
Overall liquefaction potential: 0.54

LPI = 0.00 - Liquefaction risk very low
LPI between 0.00 and 5.00 - Liquefaction risk low
LPI between 5.00 and 15.00 - Liquefaction risk high
LPI > 15.00 - Liquefaction risk very high

Abbreviations

FS: Calculated factor of safety for test point
F_L: 1 - FS
w_z: Function value of the extend of soil liquefaction according to depth
d_z: Layer thickness (ft)
LPI: Liquefaction potential index value for test point

Estimation of post-earthquake settlements



Abbreviations

q_t:	Total cone resistance (cone resistance q_c corrected for pore water effects)
I_c:	Soil Behaviour Type Index
FS:	Calculated Factor of Safety against liquefaction
Volumentric strain:	Post-liquefaction volumentric strain

Total estimated displacement: 0.00

Abbreviations

q_t: Total cone resistance
Q_{tn}: Adjusted cone resistance to an effective overburden stress of 1 atm
R_f: Friction ration
$Q_{tn,cs}$: Adjusted and corrected cone resistance due to fines
FS: Calculated factor of safety against liquefaction
D_r: Calculated relative density
$Gamma_{max}$: Calculated maximum cyclic shear strain
Lat. disp.: Lateral displacement

Abbreviations

q_t:	Total cone resistance
K_c:	Cone resistance correction factor due to fines
$Q_{tn,cs}$:	Adjusted and corrected cone resistance due to fines
I_c:	Soil behavior type index
$S_{u(liq)}/\sigma'_v$:	Calculated liquefied undrained strength ratio
$S_{u(peak)}/\sigma'_v$:	Calculated peak undrained strength ratio

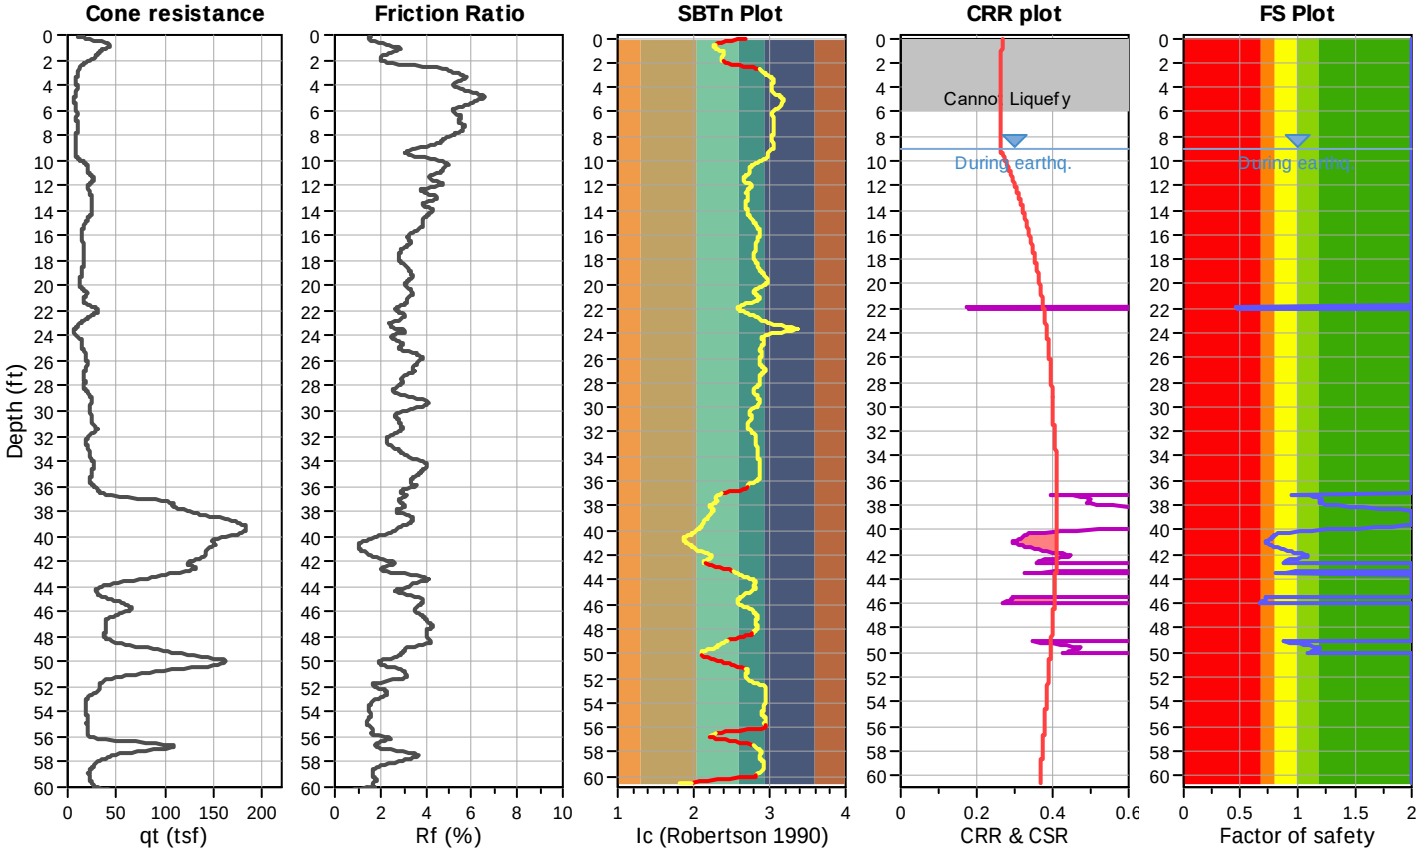
LIQUEFACTION ANALYSIS REPORT

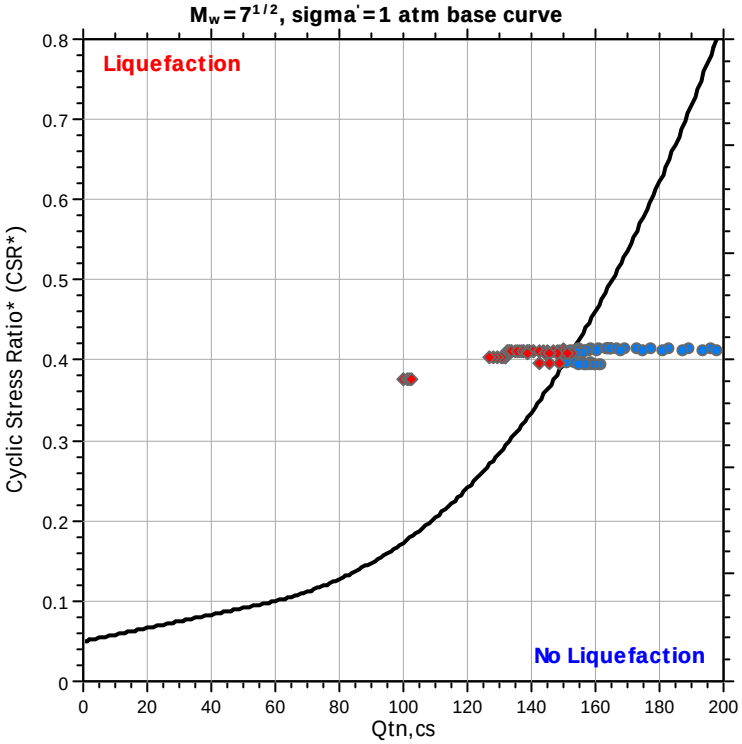
Project title : W1301-06-01 **Location : Perry Street**

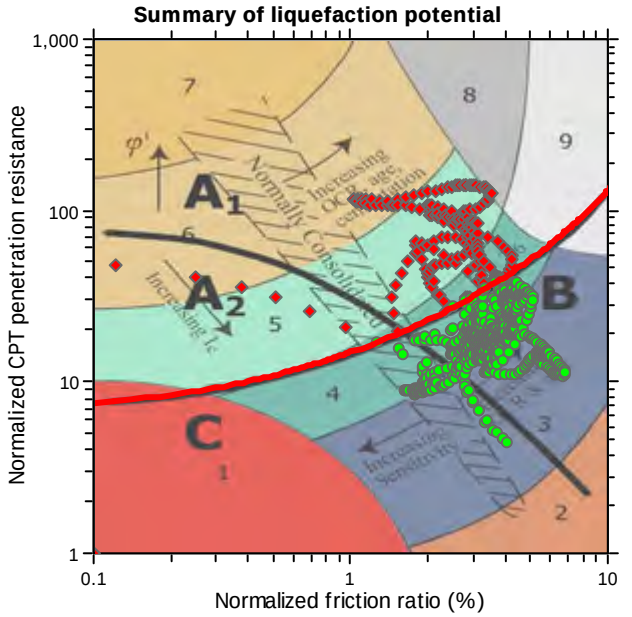
CPT file : CPT-3

Input parameters and analysis data

Analysis method:	NCEER (1998)	G.W.T. (in-situ):	12.00 ft	Use fill:	No	Clay like behavior applied:	Sands only
Fines correction method:	NCEER (1998)	G.W.T. (earthq.):	9.00 ft	Fill height:	N/A	Limit depth applied:	Yes
Points to test:	Based on Ic value	Average results interval:	.	Fill weight:	N/A	Limit depth:	50.00 ft
Earthquake magnitude M_w:	6.68	Ic cut-off value:	2.60	Trans. detect. applied:	Yes	MSF method:	Method based
Peak ground acceleration:	0.55	Unit weight calculation:	Based on SBT	K_σ applied:	Yes		







Zone A_1: Cyclic liquefaction likely depending on size and duration of cyclic loading
Zone A_2: Cyclic liquefaction and strength loss likely depending on loading and ground geometry
Zone B: Liquefaction and post-earthquake strength loss unlikely, check cyclic softening
Zone C: Cyclic liquefaction and strength loss possible depending on soil plasticity, brittleness/sensitivity, strain to peak undrained strength and ground geometry

F.S. color scheme

- Almost certain it will liquefy
- Very likely to liquefy
- Liquefaction and no liq. are equally likely
- Unlike to liquefy
- Almost certain it will not liquefy

LPI color scheme

- Very high risk
- High risk
- Low risk

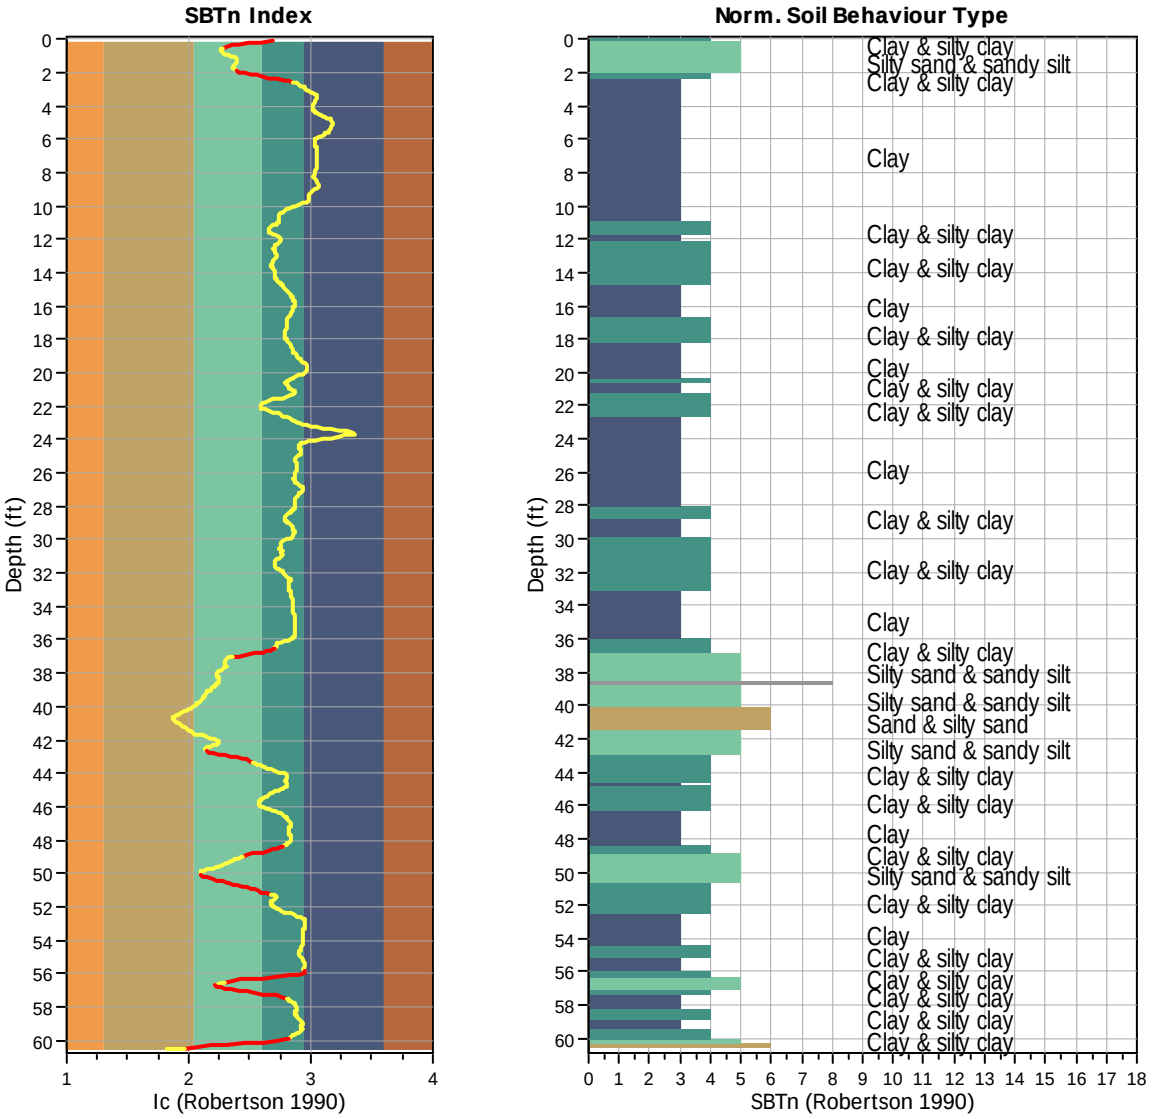
TRANSITION LAYER DETECTION ALGORITHM REPORT
Summary Details & Plots

Short description

The software will delete data when the cone is in transition from either clay to sand or vise-versa. To do this the software requires a range of I_c values over which the transition will be defined (typically somewhere between 1.80 < I_c < 3.0) and a rate of change of I_c. Transitions typically occur when the rate of change of I_c is fast (i.e. delta I_c is small).

The SBT_n plot below, displays in red the detected transition layers based on the parameters listed below the graphs.



Transition layer algorithm properties		General statistics	
I_c minimum check value:	1.70	Total points in CPT file:	924
I_c maximum check value:	3.00	Total points excluded:	101
I_c change ratio value:	0.0250	Exclusion percentage:	10.93%
Minimum number of points in layer:	4	Number of layers detected:	9

Transition layer No	Number of points	Depth	SBT_n number	SBT_n description
Transition layer 1	8	Start depth: 0.08 (ft)	4	Clay & silty clay
		End depth: 0.55 (ft)	5	Silty sand & sandy silt
Transition layer 2	12	Start depth: 1.94 (ft)	5	Silty sand & sandy silt
		End depth: 2.63 (ft)	3	Clay
Transition layer 3	9	Start depth: 36.58 (ft)	4	Clay & silty clay
		End depth: 37.08 (ft)	5	Silty sand & sandy silt
Transition layer 4	11	Start depth: 42.73 (ft)	5	Silty sand & sandy silt
		End depth: 43.39 (ft)	4	Clay & silty clay
Transition layer 5	10	Start depth: 48.44 (ft)	3	Clay
		End depth: 49.03 (ft)	5	Silty sand & sandy silt
Transition layer 6	18	Start depth: 50.22 (ft)	5	Silty sand & sandy silt
		End depth: 51.34 (ft)	4	Clay & silty clay
Transition layer 7	11	Start depth: 55.93 (ft)	3	Clay
		End depth: 56.57 (ft)	5	Silty sand & sandy silt
Transition layer 8	13	Start depth: 56.78 (ft)	5	Silty sand & sandy silt
		End depth: 57.55 (ft)	3	Clay
Transition layer 9	9	Start depth: 59.99 (ft)	4	Clay & silty clay
		End depth: 60.53 (ft)	6	Sand & silty sand

Start depth: Depth where the transition layer begins
End depth: Depth where the transition layer ends

Abbreviations

Depth: Depth from free surface, at which CPT was performed (ft)
q_c: Measured cone resistance (tsf)
f_s: Sleeve friction resistance (tsf)
u: Pore pressure (tsf)
Fines content: Percentage of fines in soil (%)
Unit weight: Bulk soil unit weight (pcf)

:: Cyclic Stress Ratio fully adjusted (CSR*) calculation data ::

Abbreviations

Depth: Depth from free surface, at which CPT was performed (ft)
σ_v: Total overburden pressure at test point (tsf)
u_0: Water pressure at test point (tsf)
σ_v': Effective overburden pressure based on GWT during earthquake (tsf)
r_d: Nonlinear shear mass factor
CSR: Cyclic Stress Ratio
MSF: Magnitude Scaling Factor
CSR_{eq}: CSR adjusted for M=7.5
K_σ: Effective overburden stress factor
CSR^*: CSR fully adjusted

Abbreviations

Depth: Depth from free surface, at which CPT was performed (ft)
q_t: Total cone resistance
I_c: Soil behavior type index
Fr: Normalized friction ratio (%)
n: Stress exponent
Q_{tn}: Normalized cone resistance
K_c: Cone resistance correction factor due to fines
$Q_{tn,cs}$: Normalized and adjusted cone resistance
$CRR_{7.5}$: Cyclic resistance ratio for M_w=7.5
FS: Factor of safety against soil liquefaction

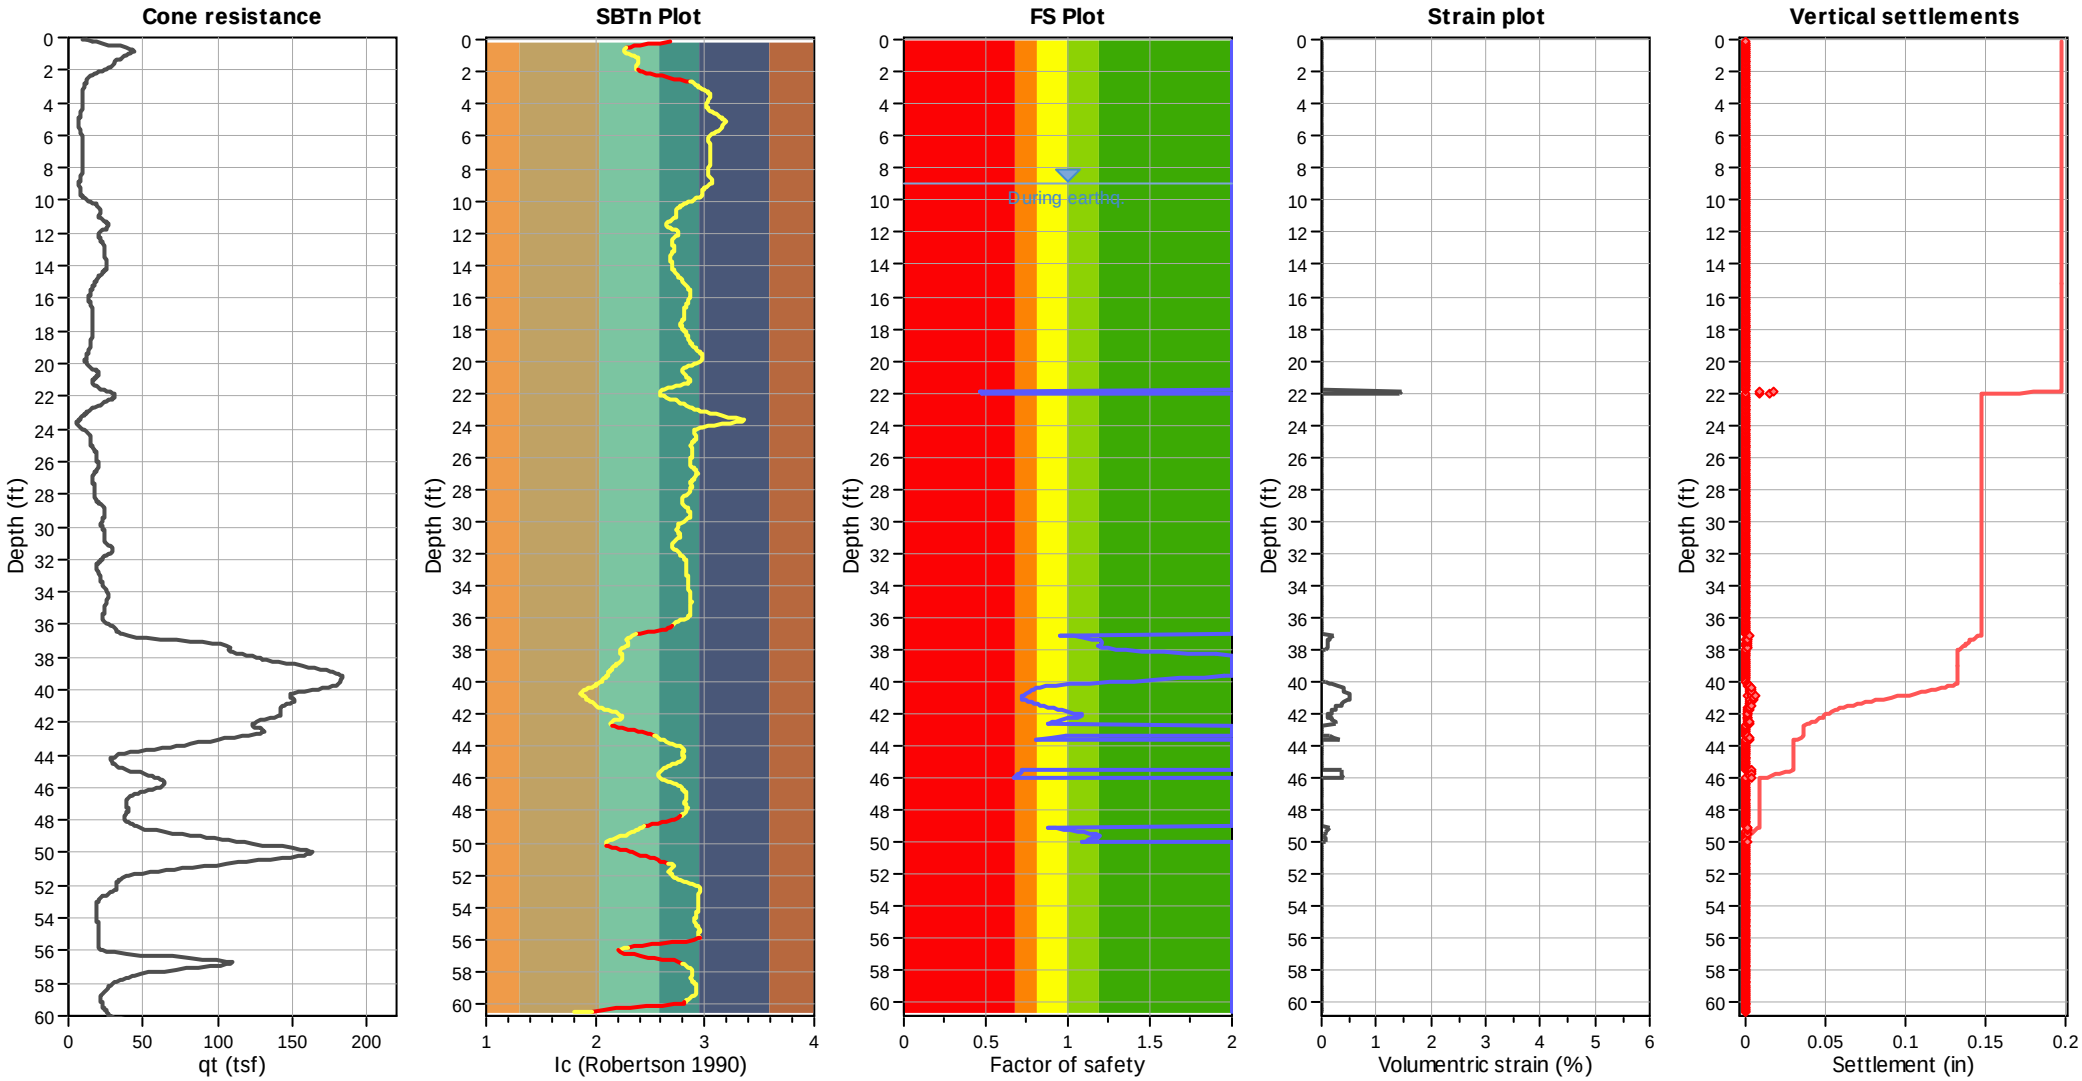
Overall liquefaction potential: 0.87

LPI = 0.00 - Liquefaction risk very low
LPI between 0.00 and 5.00 - Liquefaction risk low
LPI between 5.00 and 15.00 - Liquefaction risk high
LPI > 15.00 - Liquefaction risk very high

Abbreviations

FS: Calculated factor of safety for test point
F_L: 1 - FS
w_z: Function value of the extend of soil liquefaction according to depth
d_z: Layer thickness (ft)
LPI: Liquefaction potential index value for test point

Estimation of post-earthquake settlements



Abbreviations

q_t:	Total cone resistance (cone resistance q_c corrected for pore water effects)
I_c:	Soil Behaviour Type Index
FS:	Calculated Factor of Safety against liquefaction
Volumentric strain:	Post-liquefaction volumentric strain

Total estimated displacement: 2.13

Abbreviations

q_t: Total cone resistance
Q_{tn}: Adjusted cone resistance to an effective overburden stress of 1 atm
R_f: Friction ration
$Q_{tn,cs}$: Adjusted and corrected cone resistance due to fines
FS: Calculated factor of safety against liquefaction
D_r: Calculated relative density
$Gamma_{max}$: Calculated maximum cyclic shear strain
Lat. disp.: Lateral displacement

Abbreviations

q_t:	Total cone resistance
K_c:	Cone resistance correction factor due to fines
$Q_{tn,cs}$:	Adjusted and corrected cone resistance due to fines
I_c:	Soil behavior type index
$S_{u(liq)}/\sigma'_v$:	Calculated liquefied undrained strength ratio
$S_{u(peak)}/\sigma'_v$:	Calculated peak undrained strength ratio

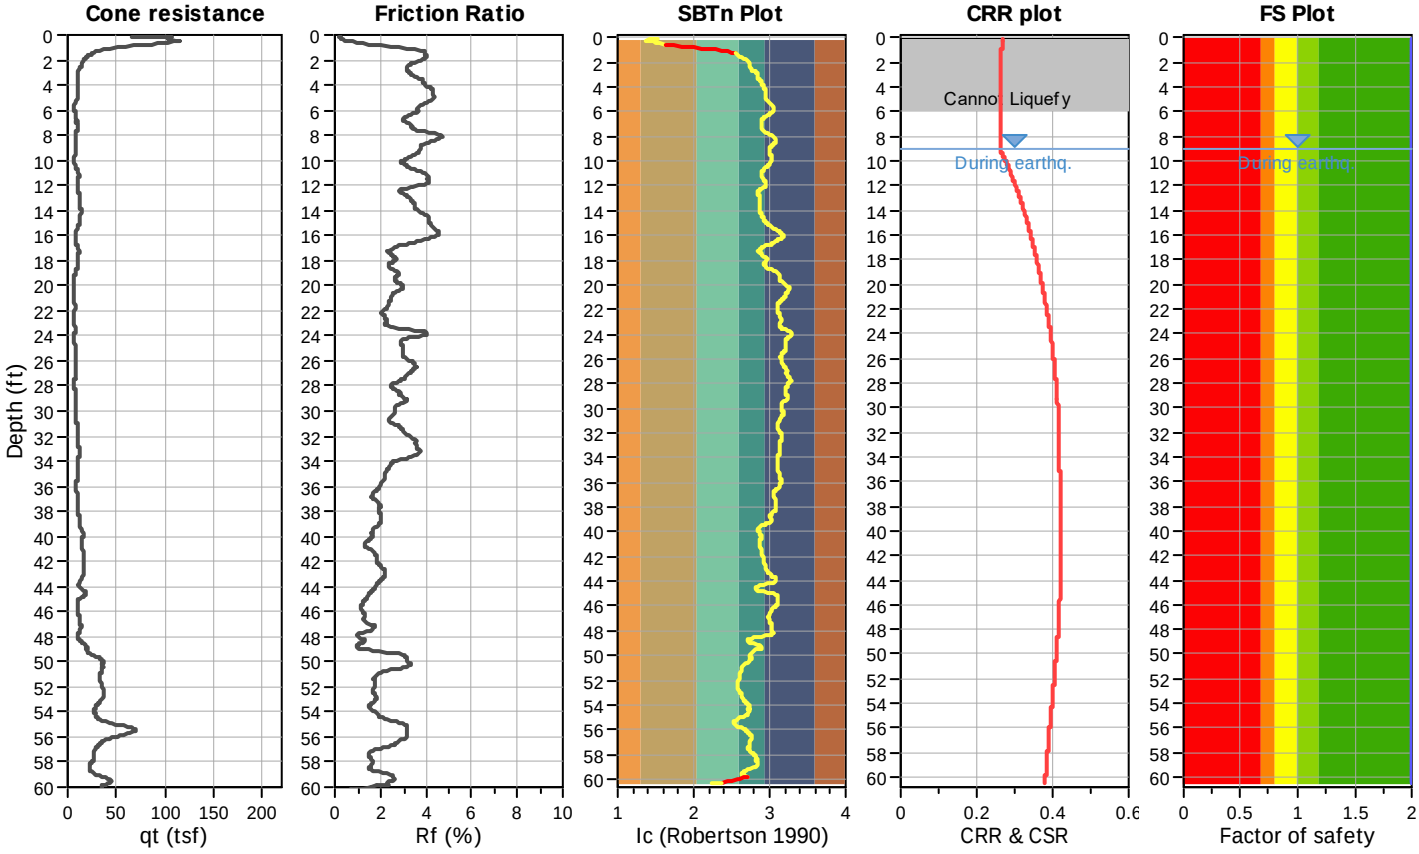
LIQUEFACTION ANALYSIS REPORT

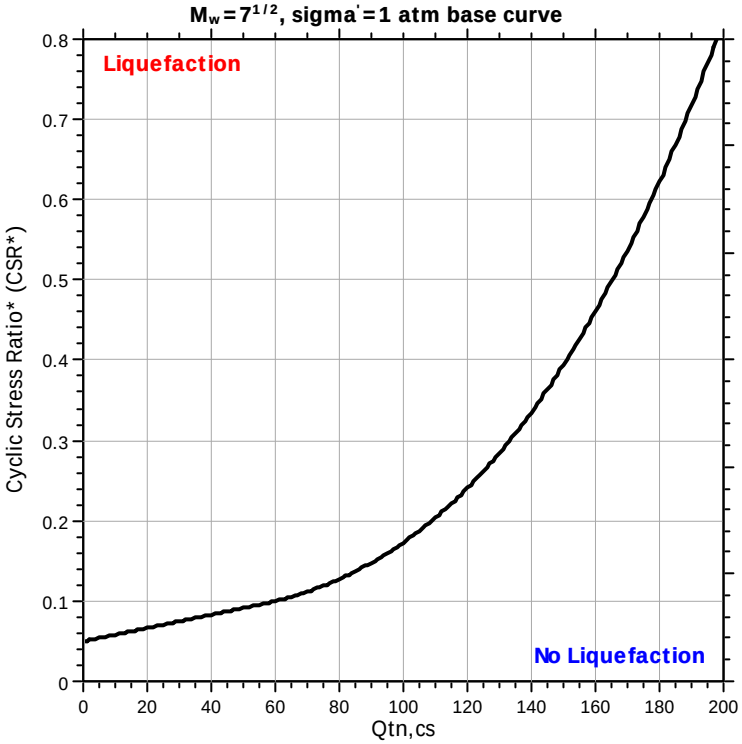
Project title : W1301-06-01 **Location : Perry Street**

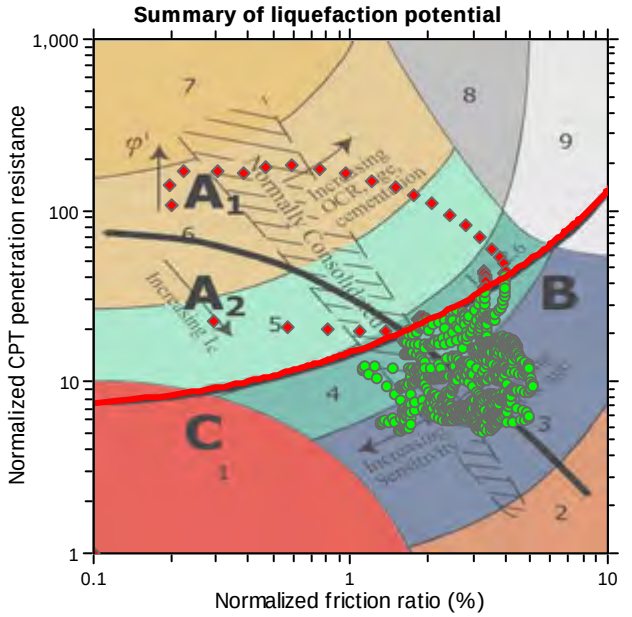
CPT file : CPT-4

Input parameters and analysis data

Analysis method:	NCEER (1998)	G.W.T. (in-situ):	12.00 ft	Use fill:	No	Clay like behavior applied:	Sands only
Fines correction method:	NCEER (1998)	G.W.T. (earthq.):	9.00 ft	Fill height:	N/A	Limit depth applied:	Yes
Points to test:	Based on Ic value	Average results interval:	.	Fill weight:	N/A	Limit depth:	50.00 ft
Earthquake magnitude M_w:	6.68	Ic cut-off value:	2.60	Trans. detect. applied:	Yes	MSF method:	Method based
Peak ground acceleration:	0.55	Unit weight calculation:	Based on SBT	K_σ applied:	Yes		

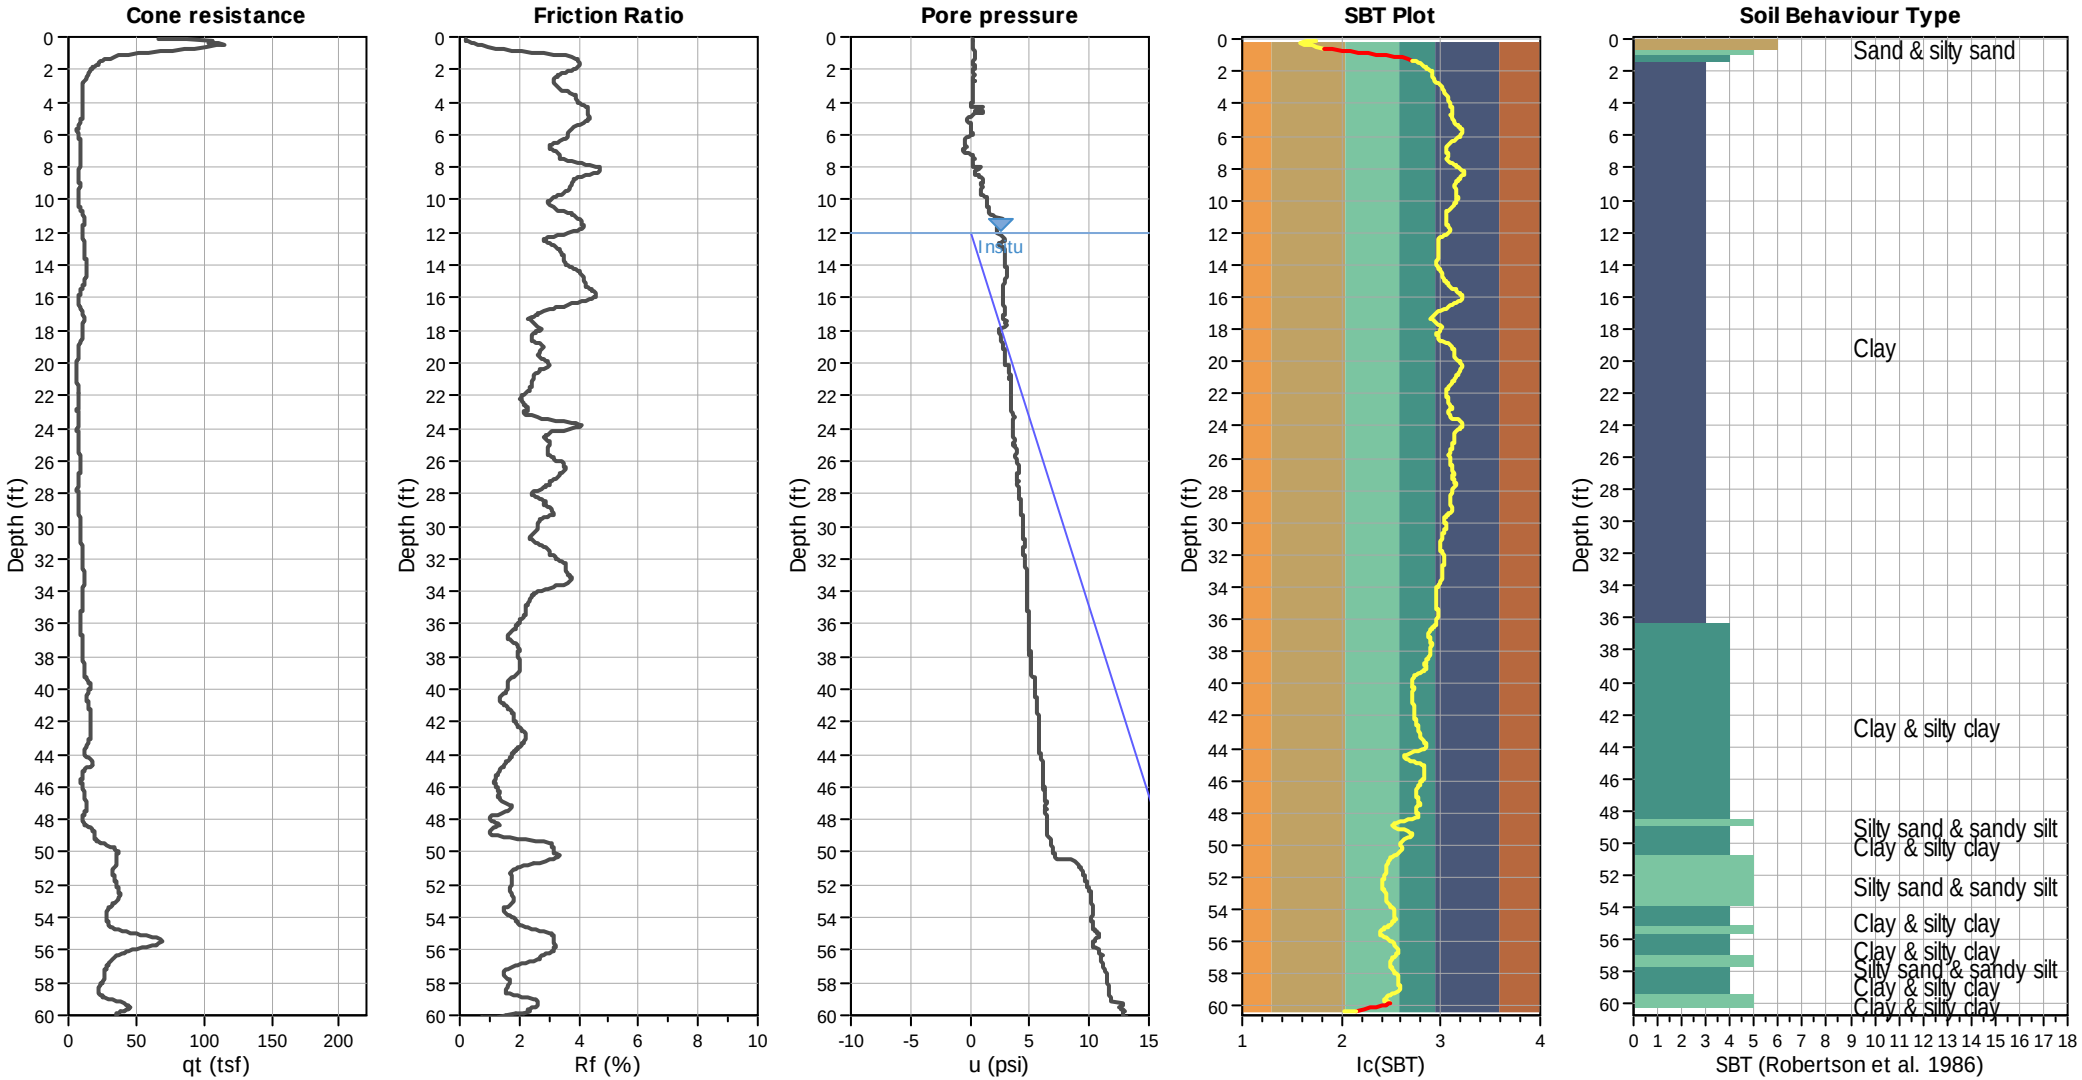






Zone A_1: Cyclic liquefaction likely depending on size and duration of cyclic loading
Zone A_2: Cyclic liquefaction and strength loss likely depending on loading and ground geometry
Zone B: Liquefaction and post-earthquake strength loss unlikely, check cyclic softening
Zone C: Cyclic liquefaction and strength loss possible depending on soil plasticity, brittleness/sensitivity, strain to peak undrained strength and ground geometry

CPT basic interpretation plots



Input parameters and analysis data

Analysis method:	NCEER (1998)	Depth to water table (erthq.):	9.00 ft	Fill weight:	N/A
Fines correction method:	NCEER (1998)	Average results interval:	.	Transition detect. applied:	Yes
Points to test:	Based on Ic value	Ic cut-off value:	2.60	K_σ applied:	Yes
Earthquake magnitude M_w:	6.68	Unit weight calculation:	Based on SBT	Clay like behavior applied:	Sands only
Peak ground acceleration:	0.55	Use fill:	No	Limit depth applied:	Yes
Depth to water table (insitu):	12.00 ft	Fill height:	N/A	Limit depth:	50.00 ft

F.S. color scheme

- Almost certain it will liquefy
- Very likely to liquefy
- Liquefaction and no liq. are equally likely
- Unlike to liquefy
- Almost certain it will not liquefy

LPI color scheme

- Very high risk
- High risk
- Low risk

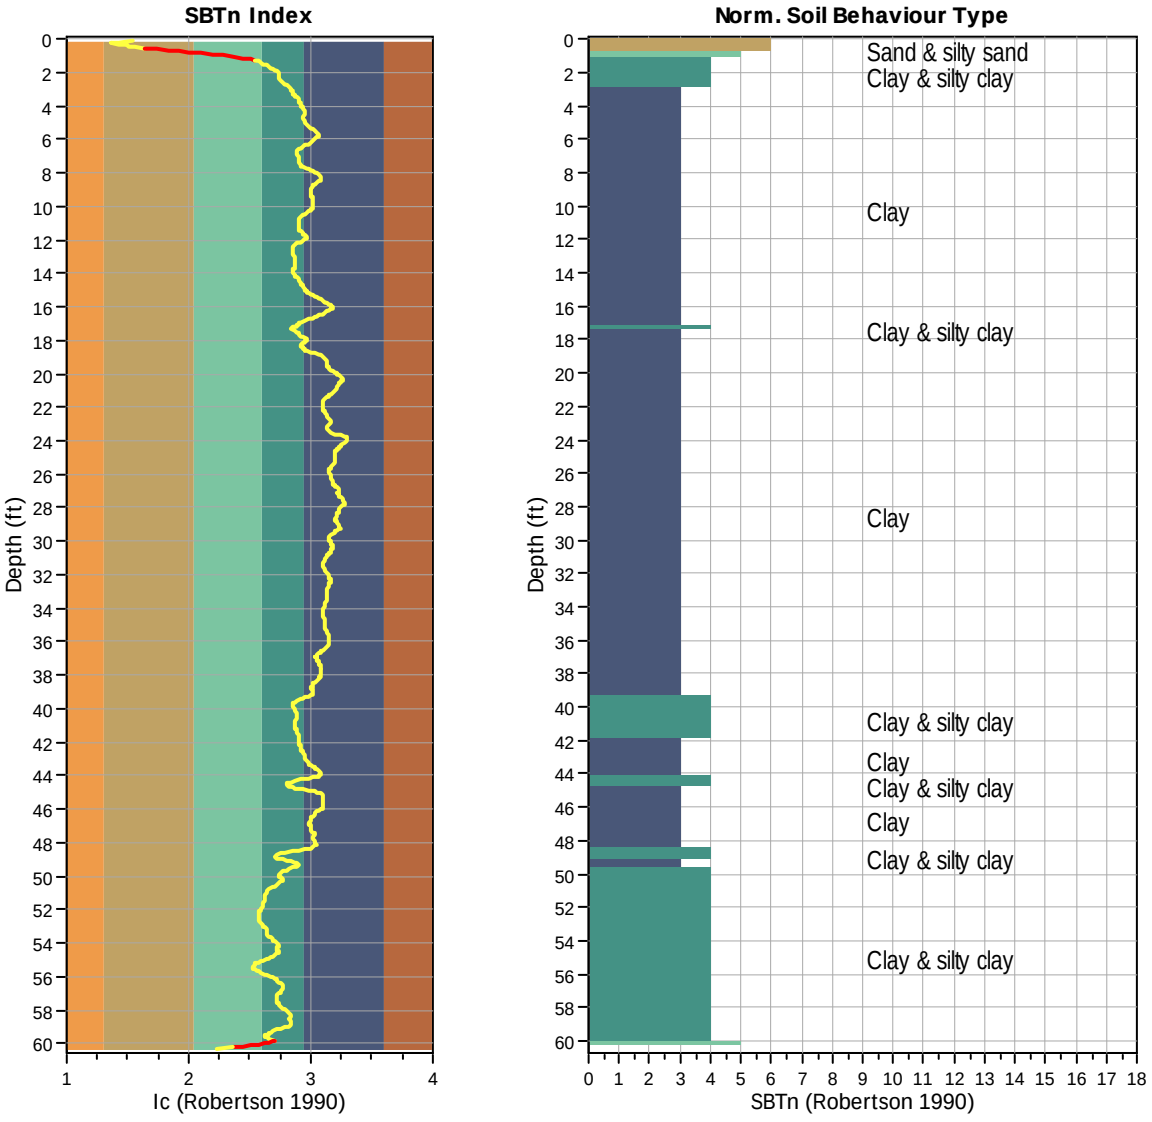
TRANSITION LAYER DETECTION ALGORITHM REPORT
Summary Details & Plots

Short description

The software will delete data when the cone is in transition from either clay to sand or vise-versa. To do this the software requires a range of I_c values over which the transition will be defined (typically somewhere between 1.80 < I_c < 3.0) and a rate of change of I_c. Transitions typically occur when the rate of change of I_c is fast (i.e. delta I_c is small).

The SBT_n plot below, displays in red the detected transition layers based on the parameters listed below the graphs.



Transition layer algorithm properties		General statistics	
I_c minimum check value:	1.70	Total points in CPT file:	921
I_c maximum check value:	3.00	Total points excluded:	20
I_c change ratio value:	0.0250	Exclusion percentage:	2.17%
Minimum number of points in layer:	4	Number of layers detected:	2

Transition layer No	Number of points	Depth	SBT_n number	SBT_n description
Transition layer 1	12	Start depth: 0.60 (ft)	6	Sand & silty sand
		End depth: 1.33 (ft)	4	Clay & silty clay
Transition layer 2	8	Start depth: 59.85 (ft)	4	Clay & silty clay
		End depth: 60.33 (ft)	5	Silty sand & sandy silt

Start depth: Depth where the transition layer begins
End depth: Depth where the transition layer ends

Abbreviations

Depth: Depth from free surface, at which CPT was performed (ft)
q_c: Measured cone resistance (tsf)
f_s: Sleeve friction resistance (tsf)
u: Pore pressure (tsf)
Fines content: Percentage of fines in soil (%)
Unit weight: Bulk soil unit weight (pcf)

:: Cyclic Stress Ratio fully adjusted (CSR*) calculation data ::

Abbreviations

Depth: Depth from free surface, at which CPT was performed (ft)
σ_v: Total overburden pressure at test point (tsf)
u_0: Water pressure at test point (tsf)
σ_v': Effective overburden pressure based on GWT during earthquake (tsf)
r_d: Nonlinear shear mass factor
CSR: Cyclic Stress Ratio
MSF: Magnitude Scaling Factor
CSR_{eq}: CSR adjusted for M=7.5
K_σ: Effective overburden stress factor
CSR^*: CSR fully adjusted
