I. INTRODUCTION

Project Description

The Carriage Crest Park project is proposed for a regional water quality improvement, in accordance with the City of Carson's contributions to the Dominguez Channel Watershed Management Area Group (DCWMA Group) Enhanced Watershed Management Program (EWMP). Carriage Crest Park was identified in the EWMP as a high priority site for a regional storm water capture project due to its proximity to two large storm drains with a total drainage area exceeding 1,100 acres. This area discharges into Wilmington Drain which subsequently discharges into Machado Lake. The project objective is to improve the quality of Machado Lake by eliminating dry-weather runoff and reducing wet-weather pollutant loading.

The City of Carson entered into a Cooperative Implementation Agreement (CIA) with Caltrans to fund the Carson Water Capture Project at Carriage Crest Park. The City of Carson entered into a subsequent agreement with the Sanitation Districts of Los Angeles County (LACSD) to manage the project, conduct engineering and geotechnical investigations, and assist with environmental clearance, permitting, design and construction management. Tetra Tech is retained to prepare the Preliminary Engineering Design Report under the direction of the LACSD. The Preliminary Engineering Design Report will provide the City of Carson with 10% design-level documents that address hydrologic, hydraulic, and water quality analytics.

A key project constraint was the known contamination in the soil underlying Carriage Crest Park, therefore infiltration cannot be employed for pollutant load reduction or groundwater recharge. Through alternative analysis, Tetra Tech has developed a recommended concept which includes:

- a diversion by gravity flow from the storm into a subsurface storage reservoir,
- a pump station that subsequently dewateres the facility to the sanitary sewer for treatment at the JWPCP,
- diversion from the storm drain at a rate of 30 cubic feet per second (cfs),
- construction of at least 11 acre-feet and up to approximately 17 acre-feet of subsurface storage under the existing ballfields, and
- nightly discharge to the sanitary sewer at a maximum rate of 20 cfs when capacity is available.

Project Location

Carriage Crest Park is a 4.8-acre parcel owned by the City of Carson at the intersection of Figueroa Street and West Sepulveda Boulevard (**Figure 1**). The park includes basketball courts, ballfields, playground equipment, a parking lot, and several structures. Carriage Crest Park is immediately north of the Joint Water Pollution Control Plant (JWPCP), and the Sanitation Districts have expressed support and interest in diverting captured stormwater to the treatment plant for treatment.

Project Schedule

The project construction is mainly at the existing baseball field which is approximately 1.8 acres. Major construction elements and expected durations are:

1. Mobilization & Demolition – September 2017 to May 2018
2. Underground Concrete Storage, Precast Installation - May 2018 to July 2018
3. Pump Station & Storm Drain Construction – July 2018 to September 2018
4. Mass Site Grading - September 2018 to November 2018
5. Aboveground Improvements - November 2018 to April 2019

*Note: Phases can be added/subtracted/combined

Traffic Study Purpose

This traffic study is prepared to mitigate the construction traffic impact introduced by the stormwater and runoff capture project at Carriage Crest Park in the City of Carson, as a part of preliminary engineering conducted by the Tetra Tech team. This study will identify the traffic impact of the open cut scenario for the storm drain construction. In addition, traffic mitigation measure will be proposed due to traffic lane closure at the intersection of Figueroa Street at West Sepulveda Boulevard.

Figure 1: Site location and vicinity map

II. Methodology

This study examines the traffic impact due to the proposed construction on Figueroa Street and the required traffic mitigations at the Figueroa Street and Sepulveda Blvd. intersection. A four stage lane by lane closure is proposed:

- **Stage 1:** Closure of Northbound lane #2 (North of Sepulveda Blvd) to construct the pipes from the pump station located at park,
- **Stage 2:** Closure of Northbound lane #1 (North of Sepulveda Blvd) to construct the pipes extending from Stage 1,
- **Stage 3:** Closure of Southbound left turn pocket (North of Sepulveda Blvd) to construct the pipes extending from Stage 2 and the rubber dam and its manholes (or remove and reconstruct the box culvert in; or to construct a drop inlet).
- **Stage 4:** Closure of Southbound lane #1 (North of Sepulveda Blvd) to construct the remaining rubber dam and its manholes (or remove and reconstruct the box culvert in; or to construct a drop inlet) from Stage 3.

Note: See Appendix for Figures of Stages

Traffic Counting

The study evaluates the potential for project impacts during the weekday AM and PM peak hours of traffic, which consist of:

- 7:00 AM – 10:00 AM for AM Peak Hours
- 4:00 PM – 7:00 PM for PM Peak Hours

In addition, tube counts to document the 24-hour directional average daily traffic (ADT) were conducted.

Intersection Levels of Service Standards and Methodology

The Congestion Management Program allows an intersection to operate at LOS “E”; however, the City requires a more stringent LOS “D”. In this analysis, minimum acceptable intersection operating conditions will follow the City guidelines for all intersections. Intersections operating LOS “E” or “F” are considered unsatisfactory. The definitions for the range of levels of service for signalized intersections under the Highway Capacity Manual are listed in **Table 1**.

For this study, Synchro 9 software was used for calculating the levels of service.

Table 1: Level of Service (LOS) Definitions for Signalized Intersections

LOS	Definition / Interpretation	Signalized Intersection Delay (seconds per vehicle)
A	Excellent operation. All approaches to the intersection appear quite open, turning movements are easily made, and nearly all drivers find freedom of operation.	≤ 10
B	Very good operation. Many drivers begin to feel somewhat restricted within platoons of vehicles. This represents stable flow. An approach to an intersection may occasionally be fully utilized and traffic queues start to form.	$> 10 \text{ and } \leq 20$
C	Good operation. Occasionally drivers may have to wait for more than 60 seconds, and backups may develop behind turning vehicles. Most drivers feel somewhat restricted.	$> 20 \text{ and } \leq 35$
D	Fair operation. Cars are sometimes required to wait for more than 60 seconds during short peaks. There are no long-standing traffic queues. This level is typically associated with design practice for peak periods.	$> 35 \text{ and } \leq 55$
E	Poor operation. Some long-standing vehicular queues develop on critical approaches.	$> 55 \text{ and } \leq 80$
F	Forced flow. Represents jammed conditions. Backups from locations downstream or on the cross street may restrict or prevent movements of vehicles out of the intersection approach lanes; therefore, volumes carried are not predictable. Potential for stop and go type traffic flow.	> 80

III. EXISTING CONDITIONS

Project Site, Vicinity and Street Network

The Carriage Crest Park is 4.8 acres in size, including baseball field, basketball fields, and a 40-space parking lot. It is assumed that the majority, if not all, of the park will be closed during the project construction. It is assumed that construction crews will park their vehicles at the park site, not on street.

West of the park and Figueroa Street is Target shopping facility. It should be noted there are two driveways on the west side of Figueroa Street. The northern driveway directly connects to the signalized intersection of SR-110 Northbound off ramp for right turns only and on red. This note is to remind the City to coordinate with Target with the potential of vehicular traffic using this route to avoid the intersection of Figueroa Street at West Sepulveda Boulevard.

The intersection of Figueroa Street at West Sepulveda Boulevard is controlled by an 8-phase traffic signal, with a left turn lane on each street approach. Also, there is a right-turn lane at the Eastbound, Westbound, and Southbound approaches, except the Northbound approach.

When vehicular movements are closed due to the project construction, the next interchange to the Interstate I-110 Freeway north of the subject intersection is at 220th Street, south of the subject intersection is at Pacific Coast Highway.

The City of Carson street system is characterized by the long street blocks in the project vicinity. Each block is about half mile to one mile long. Any traffic movement resulting from full closure at the intersection of Figueroa Street at West Sepulveda Boulevard due to the Carriage Crest Park project construction will cause vehicular traffic to detour for approximately 2 extra miles.

The roadway network in the project adjacency include Interstate I-110 Freeway, South Vermont Avenue, South Main Street, 220th Street, 223th Street, 228th Street, Lomita Boulevard, and Pacific Coast Highway. The intersection is 390 feet east of the Interstate I-110 Northbound intersection.

Existing Traffic Volumes and Operating Conditions

Traffic counts were performed by National Data and Surveying Services (NDS) for the study on February 2, 2017 and February 14, 2017. The counts included average daily traffic (ADT) and intersection turn movements.

Average Daily Traffic (ADT) Counts

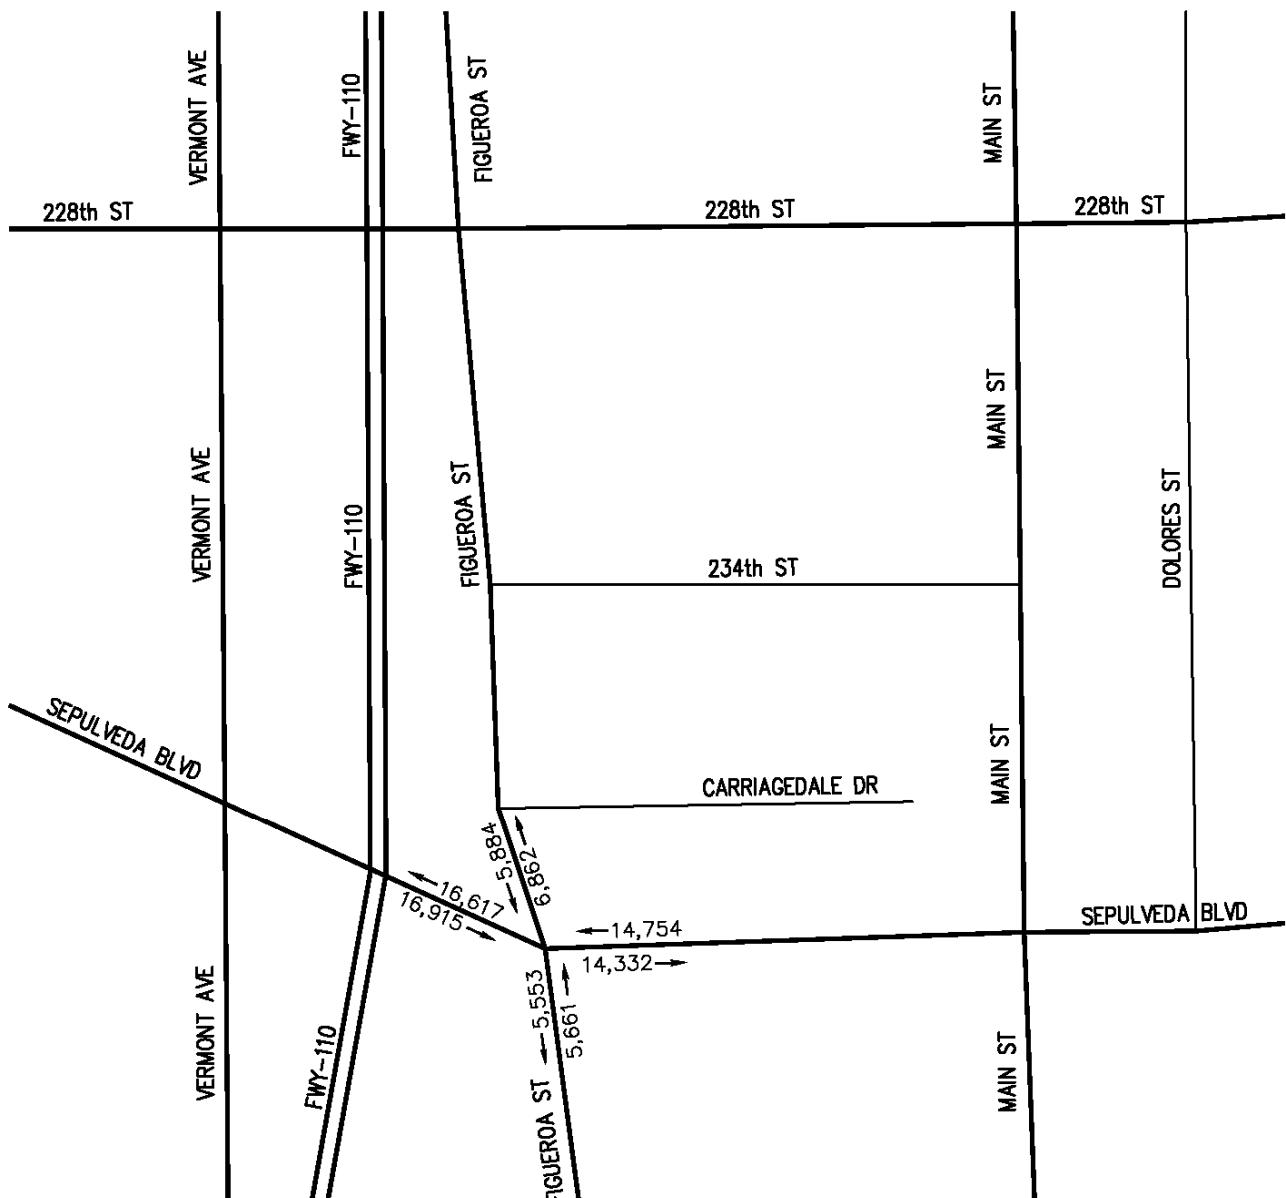

The ADT counts on Figueroa Street *north* of Sepulveda Boulevard is 12,746 vehicles, of which the Northbound ADT is 6,862 vehicles and the Southbound ADT is 5,884 vehicles. Meanwhile, the ADT counts show 11,214 vehicles on Figueroa Street *south* of Sepulveda Boulevard, comprised of 5,661 vehicles heading Northbound and 5,553 vehicles heading Southbound.

The ADT counts on Sepulveda Boulevard *east* of Figueroa Street is 29,086 vehicles, of which the Eastbound ADT is 14,332 vehicles and the Westbound ADT is 14,754 vehicles. Meanwhile, the ADT counts show 33,532 vehicles on Sepulveda Boulevard *west* of Figueroa Street, comprised of 16,915 vehicles heading Eastbound and 16,617 vehicles heading Westbound.

ADT count information is shown in **Figure 2**.

Existing Peak Hour Traffic Volumes

Weekday morning and evening peak hour counts were conducted from 7:00 to 10:00 AM and from 4:00 to 7:00 PM, respectively. The AM and PM peak hour intersection turn movements are shown in **Figure 3**.

IV. Traffic Analysis

Existing Level of Service Intersections

Table 2 summarizes the LOS during the AM and the PM peak hours for the study intersections.

- The existing LOS is C for AM and PM peak hours.
- For AM peak hours, Stage 1 to 4 LOS is “D”.
- For PM peak hours, Stage 1, 3, 4 LOS is “C” and Stage 2 LOS is “D”.

Table 2: Levels of Service for Peak Hours

2017 AM Peak				2017 PM Peak			
Alternatives	Delay (Sec)	V/C	LOS	Alternatives	Delay (Sec)	V/C	LOS
Existing	34.0	0.76	C	Existing	33.2	0.74	C
Stage 1	37.9	0.86	D	Stage 1	33.8	0.79	C
Stage 2	40.7	0.91	D	Stage 2	36.0	0.83	D
Stage 3	36.5	0.83	D	Stage 3	34.4	0.80	C
Stage 4	36.5	0.83	D	Stage 4	34.4	0.80	C

Alternative Option for Closing 2 Lanes on Southbound

An alternative option for Southbound was initially proposed, which would close off Southbound #1 lane and the left turn pocket (North of Sepulveda Blvd) for the construction of the pipes extending from Stage 2 and the rubber dam and its manholes. This proposed staging was dismissed due to the LOS increasing to an unacceptable level of “E”. The high LOS resulted in splitting the construction into two separate phases, Stage 3 and Stage 4.

Table 3 summarizes the LOS during the AM and the PM peak hours for the alternative staging.

Table 3: Level of Service for Alternative Option

2017 AM Peak				2017 PM Peak			
Alternatives	Delay (Sec)	V/C	LOS	Alternatives	Delay (Sec)	V/C	LOS
Alt Option	58.1	1.00	E	Alt Option	68.3	1.02	E

Signal Phase Timing

Due to the closure of the Southbound left turn pocket in the traffic handling concept in Stage 3, the left turn lane is being shifted to the Southbound #1 lane. To avoid the opposing left turn cars colliding, vehicles traveling Northbound and Southbound will be operating as the lead-lag operation. Lead-lag operation means that the Northbound and Southbound left turns cannot be concurrent.

For the aforementioned “Alternative Option,” the signal will be operated in split phase, which means the Northbound and Southbound movements cannot be concurrent.

Additional Trips Due to Construction

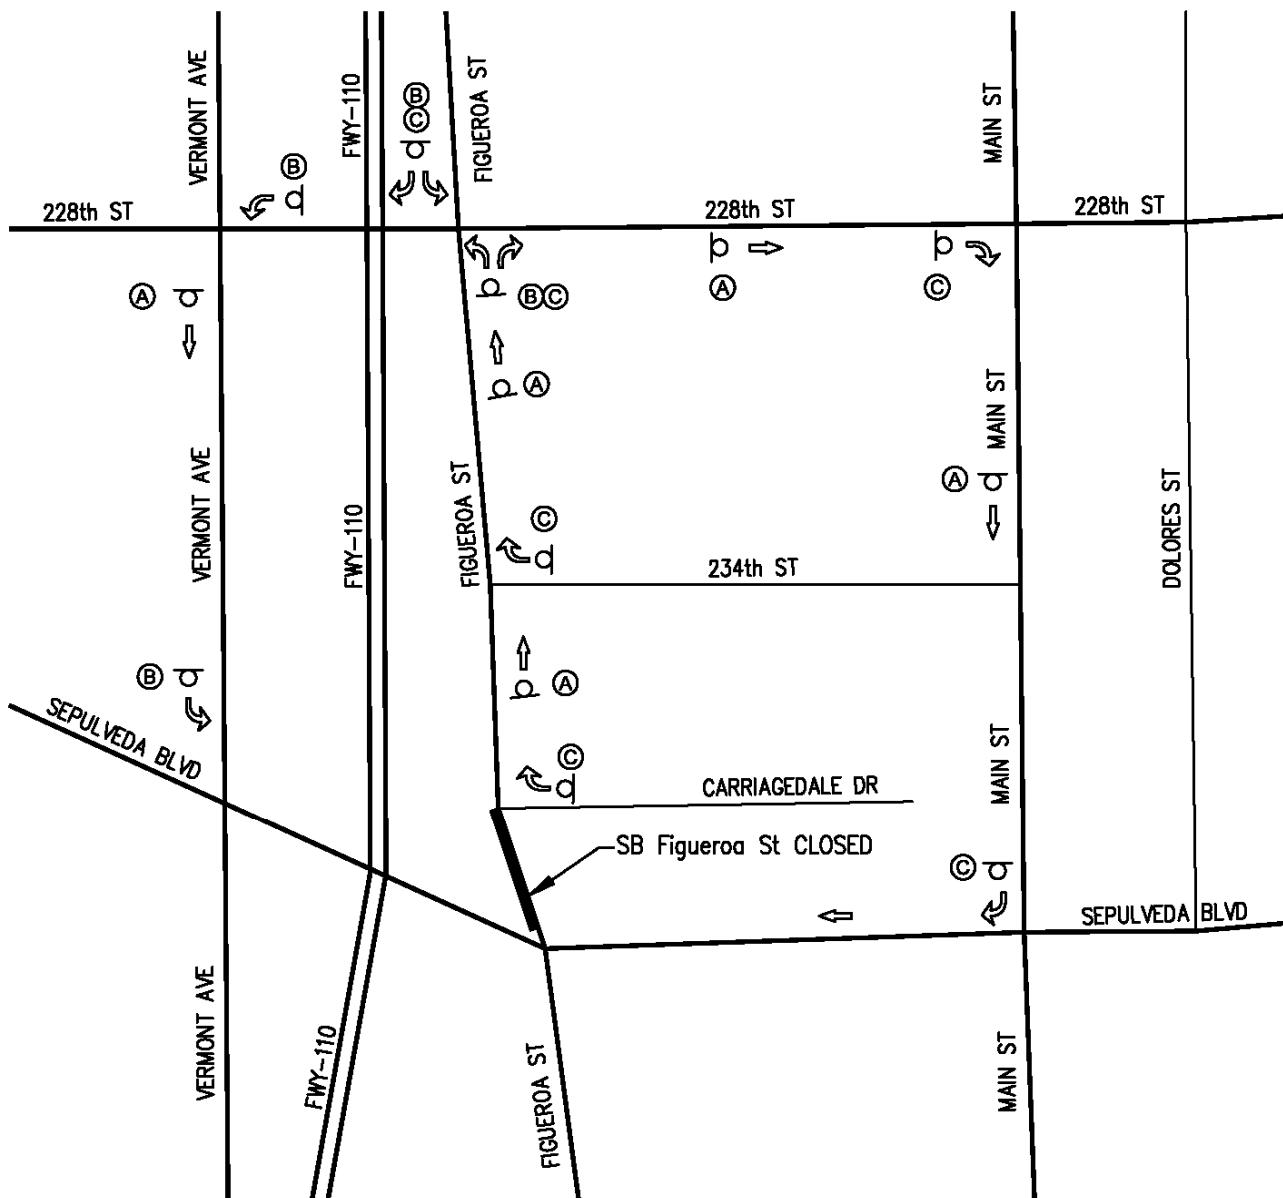

Construction trips will range from approximately 20,000 cubic yards (11 acre-feet of storage) to approximately 35,000 cubic yards (up to 17 acre-feet of storage) of excavation and transportation. For the purpose of this report it is assumed that there is 35,000 cubic yards of excavation and transportation. The 35,000 cubic yards of dirt for hauling was estimated by Tetra Tech.

The project construction in total will generate up to approximately 5,000 one-way truck trips (2,500 round truck trips). The planned hauling is approximately 40 days, operated with 8 trucks and 6 hours each day. The planned mobilization and demolition is approximately 173 days. In addition, construction trucks are planned to park on the job site and will not take up additional parking spaces. During the peak of project construction, estimated by Tetra Tech, there will be approximately 48 crew/trips at the site.

Normally construction trucks will not be using the intersection during peak hours to worsen the Level of Service (LOS).

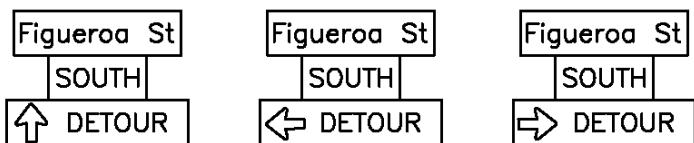

Detour Southbound

A detour map was created in the case of a full closure of the Southbound movement on Figueroa Street north of Sepulveda Boulevard, due to some unforeseen reasons. The detour is shown in **Figure 4**.

LEGEND:

← DIRECTION OF DETOUR
○ DETOUR SIGN

(B)

(C)

NO SCALE

Figure 4: Detour Map due to Full Closure

V. PRELIMINARY SUMMARY

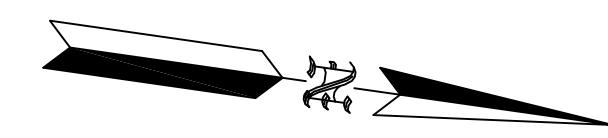

Per discussion with Tetra Tech, construction staging is desired to advance on per lane basis to avoid the LOS below D. However, the dimension of rubber dam and the associated manholes that the new storm drain pipes will connect to are in design stage. Dimensions have not been given for the rubber dam and the associated manholes, so the dimensions for traffic control concept are approximate. That is the reason why the detour plan for the Southbound full closure is prepared.

Also per Tetra Tech, the City of Carson is responsible for the maintenance of the Carriage Crest Park project. Once the project is built and in operation, it is assumed that very few maintenance vehicles are anticipated. Therefore this project is assumed no traffic impact to future conditions.

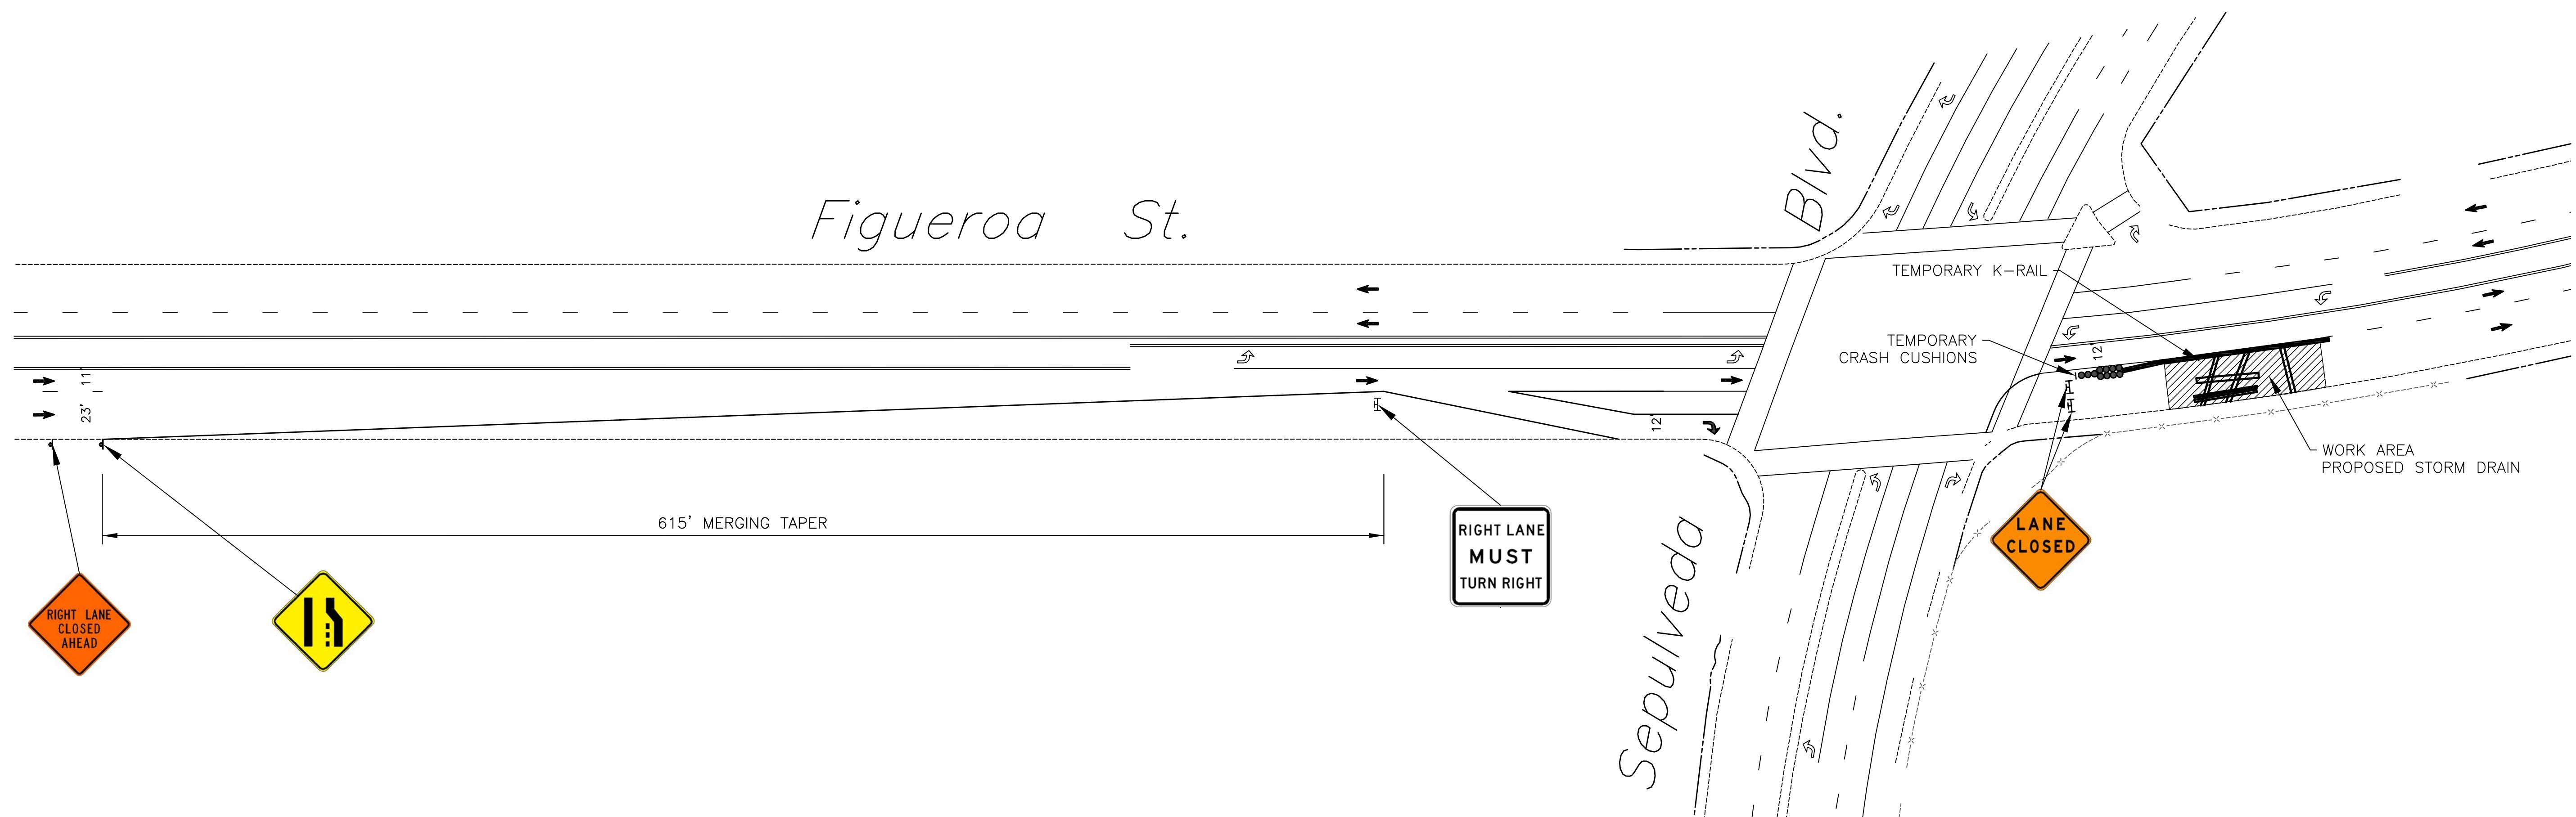

Target should be coordinated during the project construction to avoid the southbound traffic routing to its property.
