## 1. INTRODUCTION

This report documents the assumptions, methodologies, and findings of a transportation impact study conducted by Fehr & Peers to evaluate the potential traffic impacts of Victoria Greens Project in the City of Carson, California. The project is located on the northeast corner of the intersection of Central Avenue and Victoria Street, south of the State Route 91 (SR-91), in the northern portion of the City.

## PROJECT DESCRIPTION

The Project is proposed to be developed in the City of Carson in the South Bay area of Los Angeles County on a currently undeveloped site. It is located approximately 17 miles south of downtown Los Angeles and approximately 10 miles east of the Pacific Ocean. The Project site is bounded by East Victoria Street to the south, South Central Avenue to the west, and developed land to the north and east. The Project site also surrounds a small parcel fronting South Central Avenue developed with a building, a high-pressure gas pipeline, and electrical equipment. The Project site is located immediately adjacent to the California State University, Dominguez Hills (CSUDH) campus and opposite Dominguez Hills Village, approximately 0.4 miles south of the Gardena Freeway (SR-91), and 0.5 miles east of the Stub Hub Center. The Project proposes to provide 175 residential dwelling units in a low-rise garden-style multifamily setting. Two- and three-bedroom apartments will be offered. Amenities include a club house for residents with a pool and a dog park. Access to the Project will be provided by one driveway off Central Avenue, opposite Aspen Hill Road, which is a private access road to Dominguez Hills Village. Left-turns out of the Project driveway onto Central Avenue would be prohibited at all times; the prohibition will be enforced through signage and a physical barrier constructed at the project driveway. A second, egress-only driveway off Victoria Street will be gated. Figure 1 illustrates the Project site and study area. Figure 2 includes the site plan.

## STUDY SCOPE

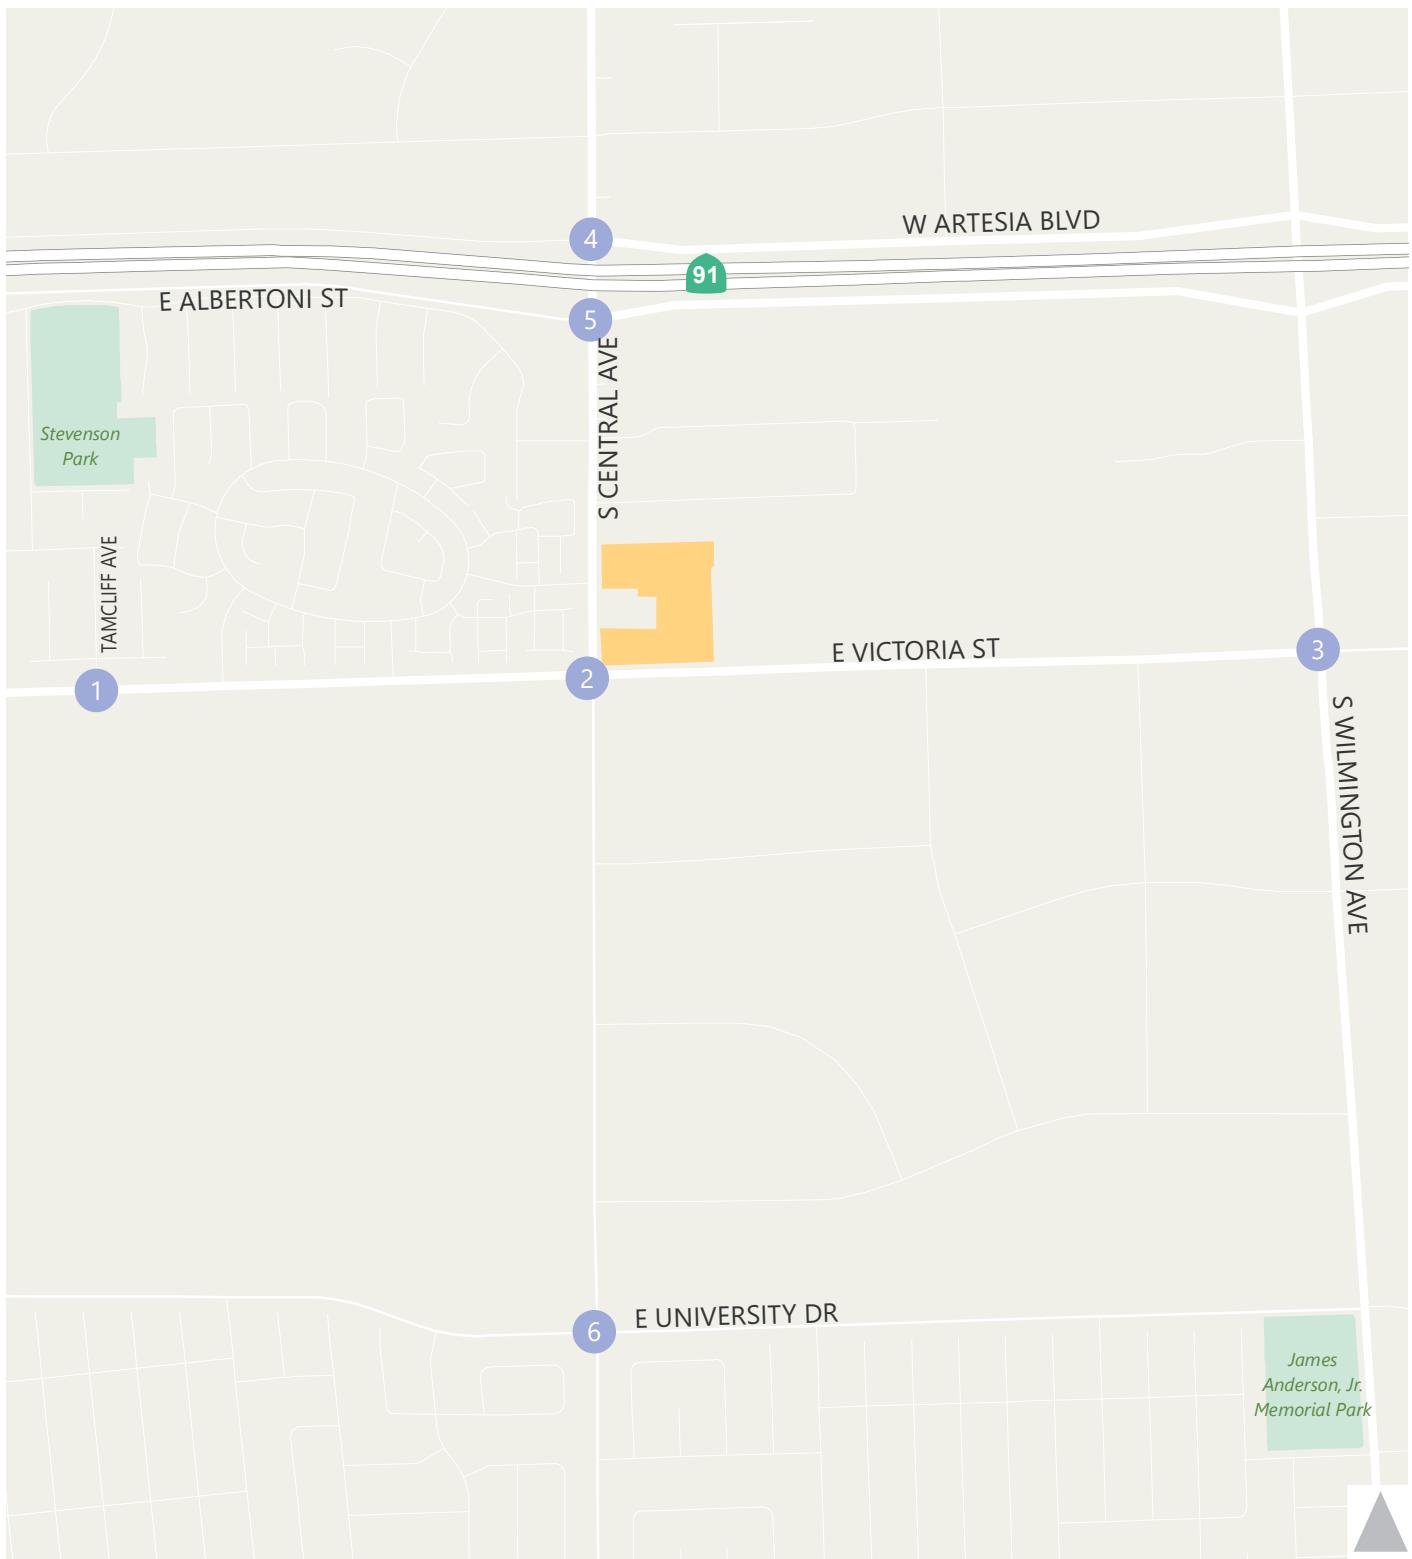

The scope of work for this study was determined in conjunction with the City of Carson's Transportation staff.

## TRAFFIC SCENARIOS

The study assumes that the Project would be completed by year 2021 and is directed at analyzing the potential project-generated traffic impacts on the local street system under both existing and future year traffic conditions. The following traffic scenarios have been developed and analyzed as part of this study:

- Existing Conditions – The analysis of existing traffic conditions is intended to provide a basis for the remainder of the study. The existing conditions analysis includes a description of the transportation system serving the Project site, existing traffic volumes, and an assessment of the operating conditions at the study analysis locations described below. This scenario is described in detail in Chapter 2.
- Existing plus Project Conditions – This traffic scenario provides projected traffic volumes and an assessment of operating conditions under existing conditions with the addition of project-

Study Intersections

Project Site

Figure 1  
Project Location and Study Intersections

Figure 2  
Site Plan

generated traffic. The impacts of the proposed Project on existing traffic operating conditions were then identified. This scenario is described in detail in Chapter 4.

- Future Base (Year 2021) Conditions – Future traffic projections without the proposed Project were developed for the year 2021. The objective of this analysis was to project future traffic growth and operating conditions that could be expected to result from regional growth, cumulative projects, and transportation network changes in the vicinity of the Project site by the year 2021. This scenario is described in detail in Chapter 3.
- Future (Year 2021) plus Project Conditions – This traffic scenario provides projected traffic volumes and an assessment of operating conditions under future conditions with the addition of Project-generated traffic. The impacts of the proposed Project on future traffic operating conditions were then identified. This scenario is described in detail in Chapter 4.

## STUDY INTERSECTIONS

A total of six intersections were selected for the analysis of the Project in consultation with the City of Carson. All six intersections are signalized (Figure 1). Three of the study intersections are located in the City of Carson, two are located in the City of Compton, and one is located in the Dominguez Hills area in unincorporated Los Angeles County.

### Signalized Intersections

The following signalized intersections, illustrated in Figure 1, were identified in conjunction with the City of Carson to be analyzed as part of the scope of work for this Project:

1. Tamcliff Avenue & East Victoria Street (City of Carson)
2. South Central Avenue & East Victoria Street (City of Carson)
3. South Wilmington Avenue & East Victoria Street (Los Angeles County)
4. South Central Avenue & East Artesia Boulevard/SR 91 westbound ramps (City of Compton, operated by Los Angeles County)
5. South Central Avenue & East Albertoni Street/SR 91 eastbound ramps (City of Compton, operated by Los Angeles County)
6. South Central Avenue & East University Drive (City of Carson)

### Regional Transportation Impact Analysis

Regional access to the Project site is provided by the Gardena Freeway located approximately 0.4 miles north of the Project site, the Harbor Freeway located approximately 2.3 miles west of the Project site, the San Diego Freeway located approximately 2.6 miles southwest of the Project site, and Long Beach Freeway located approximately 4 miles east of the project site.

Chapter 5 discusses the regional transportation impact analysis conducted according to the 2010 *Congestion Management Program* (CMP) (Metro, 2010), including a discussion of CMP arterial monitoring stations, freeway impact analysis, and regional transit impact analysis.

## ORGANIZATION OF REPORT

This report is divided into six chapters, including this introduction. Chapter 2 describes the existing conditions including an inventory of the streets, highways, and transit service in the study area, a summary of existing traffic volumes, and an assessment of existing operating conditions. The methodologies used to develop traffic forecasts for the Existing, Existing plus Project, Future Base, and Future plus Project scenarios and the forecasts themselves are included in Chapter 3. Chapter 4 presents an assessment of potential intersection traffic impacts of the proposed Project under both existing and future conditions, including an analysis of whether the addition of the Project driveway warrants a traffic signal. Chapter 5 provides a regional transportation impact analysis. Chapter 6 provides the summary and conclusions.

## 2. EXISTING CONDITIONS

A comprehensive data collection effort was undertaken to develop a detailed description of existing conditions in the study area. The assessment of conditions relevant to this study includes a description of the study area, an inventory of the local street system in the vicinity of the Project site, a review of traffic volumes on these facilities, an assessment of the resulting operating conditions, and the current transit service in the study area. A detailed description of these elements is presented in this chapter.

### STUDY AREA

The Project site is within the City of Carson. The study area selected for analysis extends to include Tamcliff Avenue/Perimeter Road to the west, South Wilmington Avenue to the east, Artesia Boulevard to the north, and East University Drive to the south. The streets in the study area are under the jurisdiction of the City of Carson, City of Compton, and Los Angeles County.

### EXISTING STREET SYSTEM

As illustrated in Figure 1, the Project site is located at the northeast corner of South Central Avenue and East Victoria Street. I-405, I-710, SR-91, and the Harbor Freeway (I-110) provide regional access to the Project site.

Major arterials serving the study area include Central Avenue and Wilmington Avenue in the north/south direction, and Victoria Street and University Drive in the east/west direction.

The characteristics of the freeways and major roadways serving the study area are described below.

#### FREEWAYS

- **State Route 91** runs in the east/west direction, extending from I-110, west of the study area, east through Anaheim. In the vicinity of the study area, the freeway provides four lanes and one carpool lane in each direction plus auxiliary lanes. Ramps are provided at Avalon Boulevard, Central Avenue, and Wilmington Avenue.

#### NORTH/SOUTH STREETS

- **Central Avenue** runs in the north/south direction adjacent to the Project site in the City of Carson and north into the City of Compton. Central Avenue has two travel lanes in each direction with left-turn pockets present at major intersections. Parking is not permitted on either side of the street within the study area.
- **Wilmington Avenue** runs in the north/south direction east of the Project site in unincorporated Los Angeles County. Wilmington Avenue has three travel lanes in each direction with left-turn pockets present at major intersections.

## EAST/WEST STREETS

- **Victoria Street** runs in the east/west direction adjacent to the Project site in the City of Carson west of Wilmington Avenue and in unincorporated Los Angeles County east of Wilmington Avenue. Victoria Street has two travel lanes in each direction with left-turn pockets present at major intersections and a center turn lane east of Bishop Avenue. Parking is permitted on one or both sides of the street west of Central Avenue and east of Bishop Avenue.
- **University Drive** runs in the east/west direction south of the Project site with two travel lanes and a bike lane in each direction, separated by a landscaped median through the majority of the study area and left-turn pockets at major intersections. Parking is not permitted on either side of the street.

Lane configurations of the study intersections are provided in Appendix A.

## EXISTING PUBLIC TRANSIT SERVICE

The Project site is served by public transit. The Project is directly served by Los Angeles County Metropolitan Transportation Authority (Metro) Local Route 53 (north-south service from Downtown LA to CSUDH) and Route 130 (east-west service from Artesia to Redondo Beach), Carson Circuit Route A, and Torrance Transit Route 6, which all stop at a bus stop on Central Avenue just south of the project driveway. The proposed Project will work with Metro to improve the existing bus stop.

Additional transit service is available on Long Beach Transit (Route 1) and Compton Renaissance Transit (Route 5) via a stop at CSUDH, and on Metro Local Route 205 which runs north-south along Wilmington Avenue within the vicinity of the proposed Project.

## EXISTING BICYCLE AND PEDESTRIAN FACILITIES

The study area has a limited existing bikeway network which includes a Class I shared use path that runs north-south along the west side of Central Avenue between Aspen Hill Road and University Drive, and a marked Class II bicycle lane that runs east-west along either side of University Drive. The Class I path that runs along the west side of Central Avenue varies in width from 8 feet to 12 feet to 16 feet, depending on intermittent landscaping dividing the pathway in two or the presence of a parkway buffering users from the adjacent roadway. There is no identifying or wayfinding signage provided along the pathway. From south to north, the pathway begins at University Drive. From University Drive to Glen Curtiss Street, the pathway runs 615 feet uninterrupted. Widths vary from 12 feet to 16 feet. A planted parkway is present intermittently. At the signalized intersection with Glen Curtiss Street, a standard crosswalk is provided. From Glen Curtiss Street north to the side-street stop-controlled intersection with Gate G Stub Hub Center entrance/Charles Willard Street, the pathway runs uninterrupted for 1,785 feet. Widths vary from 8 feet to 12 feet, depending on variable landscaping that divides the path into two 8-foot lanes in some sections. From Gate G Stub Hub Center entrance/Charles Willard Street north to Victoria Street, the pathway runs 950 feet and is interrupted by two driveways into a light industrial park. The driveway intersections are uncontrolled. At the signalized intersection with Victoria Street, a standard crosswalk is provided. The pathway terminates approximately 405 feet north of Victoria Street at the side-street stop-controlled T-intersection with Aspen Hill Road,

opposite the planned Project driveway. The pathway along this section is evenly divided into two 8-foot lanes by a 2-foot planted median; however, the pathway adjacent to the roadway competes for space with street trees, utility boxes, streetlights, and sidewalk furniture. No marked crossing is provided across Aspen Hill Road to connect the pathway to the sidewalk on the north side of the intersection.

A robust network of additional facilities and improvements are planned as part of the City of Carson *Master Plan of Bikeways* (2013), including a colored buffered bike lane on Central Avenue from the Gardena Freeway to University Drive, a colored bicycle lane along University Drive from Wilmington Avenue to Avalon Boulevard, and a buffered bicycle lane along Victoria Street from Wilmington Avenue to the western edge of the CSUDH campus.

Pedestrian facilities in the study area are limited. Sidewalks are not uniformly provided. There is no sidewalk along the east side of Central Avenue, adjacent to the proposed Project site. The proposed Project has been conditioned by the City to construct missing segments of sidewalk along the project's frontage on Central Avenue. This will result in the removal of on-street parking along this section of roadway.

## EXISTING TRAFFIC VOLUMES AND LEVEL OF SERVICE

This section presents existing base peak hour traffic volumes, describes the methodology used to assess the traffic conditions at each intersection, and analyzes the resulting operating conditions at each, indicating volume-to-capacity (V/C) ratios and levels of service (LOS).

### EXISTING TRAFFIC VOLUMES

Weekday AM and PM peak hour turning movement counts were collected at the study intersections in March 2018. The existing weekday morning and afternoon peak hour volumes at the study intersections are provided in Appendix A. Traffic count worksheets for these intersections are contained in Appendix B.

### LEVEL OF SERVICE (LOS) METHODOLOGY

All three study area jurisdictions utilize the Intersection Capacity Utilization (ICU) methodology to determine LOS. The ICU method estimates the V/C ratio for an intersection based on the individual V/C ratios for the conflicting traffic movements. The ICU value represents the percent signal green time of capacity of the intersection movements. It should be noted that the ICU methodology assumes uniform traffic distribution per intersection approach lane and optimal signal timing. The overall intersection V/C ratio is subsequently assigned an LOS value to describe intersection operations in Table 1. LOS ranges from LOS A (free flow) to LOS F (jammed condition). The standard LOS methodology varies by jurisdiction. Study intersections are analyzed according to the methodology of the appropriate jurisdiction.

### EXISTING 2018 LEVELS OF SERVICE

Existing year traffic volumes presented in Appendix A were analyzed using the methodologies described above to determine the existing operating conditions at the study intersections. Table 2 summarizes the results of the analysis of the existing weekday morning and evening peak hour V/C ratio and corresponding LOS at each of the analyzed intersections. Existing LOS were analyzed with the current lane configurations

observed in the field. Four of the six signalized intersections currently operate at LOS A or B during both peak periods. The intersections of Central Avenue & Artesia Boulevard and Central Avenue & Albertoni Street, both in the City of Compton, currently operate at LOS C during both peak periods. Detailed LOS analysis sheets for the Project are provided in Appendix C.

**TABLE 1 - LEVEL OF SERVICE DEFINITIONS FOR SIGNALIZED INTERSECTIONS**

**CITY OF CARSON, CITY OF COMPTON, AND LA COUNTY  
ICU METHODOLOGY**

<b>Level of Service</b>	<b>Volume/Capacity Ratio</b>	<b>Definition</b>
A	0.000 - 0.600	EXCELLENT. No vehicle waits longer than one red light and no approach phase is fully used.
B	>0.600 - 0.700	VERY GOOD. An occasional approach phase is fully utilized; many drivers begin to feel somewhat what restricted within groups of vehicles.
C	>0.700 - 0.800	GOOD. Occasionally drivers may have to wait through more than one red light; backups may develop behind turning vehicles.
D	>0.800 - 0.900	FAIR. Delays may be substantial during portions of the rush hours, but enough lower volume periods occur to permit clearing of developing lines, preventing excessive backups.
E	>0.900 - 1.000	POOR. Represents the most vehicles intersection approaches can accommodate; may be long lines of waiting vehicles through several signal cycles.
F	> 1.000	FAILURE. Backups from nearby locations or on cross streets may restrict or prevent movement of vehicles out of the intersection approaches. Tremendous delays with continuously increasing queue lengths

Notes

[1] Methodologies and impact thresholds vary by Jurisdiction.

## 3. TRAFFIC PROJECTIONS

### PROJECT TRAFFIC

The development of trip generation estimates for the proposed Project involves the use of a 3-step process similar to that discussed for the cumulative projects: trip generation, trip distribution, and traffic assignment.

#### PROJECT TRIP GENERATION

As indicated in Chapter 1, the proposed Project would include the construction of 175 residential units.

Trip generation rates from *Trip Generation, 10<sup>th</sup> Edition* (Institute of Transportation Engineers [ITE], 2017) were used to estimate the number of trips associated with the Project. As shown in Table 3, the Project is projected to generate an estimated net increase of 1,281 daily trips, including 81 trips (19 inbound/62 outbound) during the AM peak hour and 98 trips (62 inbound/36 outbound) during the PM peak hour.

#### PROJECT TRAFFIC DISTRIBUTION

The geographic distribution of traffic generated by the proposed Project depends on several factors. These include the type and density of the proposed land use, the locations of employment and commercial centers to which residents of the Projects may be drawn, and the location of the Project's access points in relation to the surrounding street system. Considering those factors, a trip distribution pattern was developed for the Project and the corresponding percentage of traffic likely to be regionally oriented and using the freeway as opposed to the local street system. Figure 3 illustrates the Project's trip distribution pattern.

#### PROJECT TRAFFIC ASSIGNMENT

The traffic expected to be generated by the proposed Project was assigned to the street network using the distribution patterns described in Figure 3. Appendix A shows the assignment of Project-only traffic volumes for the morning and afternoon peak hours at the six analyzed intersection locations.

### EXISTING PLUS PROJECT TRAFFIC CONDITIONS

The Project traffic estimated and assigned to the study intersections was added to the existing traffic volumes to estimate Existing plus Project traffic volumes. Turning movement traffic volumes for the Existing plus Project scenario are provided in Appendix A. Analysis sheets are provided in Appendix C.

### FUTURE YEAR 2021 TRAFFIC CONDITIONS

To evaluate the potential impacts of the proposed Project on future (Year 2021) conditions, it was necessary to develop estimates of future traffic conditions in the area both without and with Project traffic. First, estimates of traffic growth were developed for the study area to forecast future conditions without the Project. These forecasts included traffic increases as a result of both regional ambient traffic growth and

Study Intersections

Project Site

X% Trip Distribution

Figure 3

## Regional Project Trip Distribution

traffic generated by specific developments in the vicinity of the Project (related projects). Including both ambient growth and trips from specific projects proposed within the vicinity of the Project provides a conservative estimate of future traffic projections.

These projected traffic volumes, identified herein as the Future Base conditions, represent the future conditions without the proposed Project.

## BACKGROUND OR AMBIENT GROWTH

Based on historic trends and at the direction of the City of Carson, it was established that an ambient growth factor of 0.5% per year should be applied to adjust the existing base year traffic volumes to reflect the effects of regional growth and development by year 2021. This growth factor was developed based on regional growth patterns, the Southern California Association of Governments (SCAG) 2016 Regional Transportation Plan Model, the *2010 Congestion Management Program*, and at the direction of the City of Carson. This growth factor was applied to the 2018 traffic volume data to reflect the effect of ambient growth by the year 2021.

## RELATED PROJECT TRAFFIC GENERATION AND ASSIGNMENT

Future Base traffic forecasts include the effects of known specific projects, called related projects, expected to be implemented in the vicinity of the proposed Project site prior to the buildout date of the proposed Project. The list of related projects was prepared based on data from the City of Carson, the City of Compton, and the County of Los Angeles. A total of 12 related projects were identified in the study area; these projects are listed in Table 4 and illustrated in Figure 4. One of the related projects included in this analysis is the expected buildout of the California State University, Dominguez Hills campus Master Plan Alternative 2. As the first phase of the Master Plan development is not expected to be complete until the year 2025, growth resulting from implementation of Master Plan elements was interpolated for the year 2021, when the proposed Project is expected to be complete.

### Trip Generation

Trip generation estimates for the related projects were calculated using a combination of publicly available environmental documentation, and trip generation rates contained in *Trip Generation, 10<sup>th</sup> Edition*. Table 4 presents the resulting trip generation estimates for these related projects. These trip generation projections are conservative in that they do not in every case account for either the existing uses to be removed or the possible use of non-motorized travel modes (transit, walking, etc.). Traffic mitigation measures associated with the related projects are also not in every case accounted for in the analysis.

### Trip Distribution

The geographic distribution of the traffic generated by the related projects is dependent on several factors. These factors include the type and density of the proposed land uses, the geographic distribution of population from which employees and potential patrons of proposed commercial developments may be drawn, the locations of employment and commercial centers to which residents of residential projects may be drawn, and the location of the projects in relation to the surrounding street system. Additionally, if the

traffic study or environmental document for a related project was available, the trip distribution from that study was used. Using the estimated trip generation and trip distribution patterns described above, traffic generated by the related projects was assigned to the street network.

## TRANSPORTATION INFRASTRUCTURE PROJECTS

No transportation infrastructure projects are currently planned or occurring in the vicinity of the Project site.

## FUTURE YEAR 2021 BASE TRAFFIC VOLUMES

Future year 2021 Base weekday AM and PM peak hour traffic volumes and lane geometries for the analyzed intersections are provided in Appendix A. The Future Base traffic conditions represent an estimate of future conditions without the proposed Project inclusive of the ambient background growth and related projects traffic.

## FUTURE PLUS PROJECT TRAFFIC PROJECTIONS

The proposed Project traffic volumes were added to the year 2021 Future Base traffic projections, resulting in Future (year 2021) plus Project AM and PM peak hour traffic volumes. The Future (year 2021) plus Project scenario presents future traffic conditions with the completion of the proposed Project. Appendix A shows the lane configurations and volumes analyzed as part of the Future plus Project scenario.

## Related Projects

## 4. INTERSECTION TRAFFIC IMPACT ANALYSIS

The traffic impact analysis evaluates the projected LOS at each study intersection under the Existing plus Project and Future (year 2021) plus Project conditions to estimate the incremental increase in the V/C ratio caused by the proposed Project. This provides the information needed to assess the potential impact of the Project using significance criteria established by the City of Carson, City of Compton, and Los Angeles County.

### CRITERIA FOR DETERMINATION OF SIGNIFICANT TRAFFIC IMPACT

#### SIGNALIZED INTERSECTIONS

##### **City of Carson**

The City of Carson has established threshold criteria to determine significant traffic impact of a proposed project in its jurisdiction. A signalized intersection would be significantly impacted with an increase in V/C ratio equal to or greater than 0.02 for intersections operating at LOS E or F after the addition of project traffic. Intersections operating at LOS A, B, C, or D after the addition of project traffic are not considered significantly impacted regardless of the increase in V/C ratio. The following summarizes the significant impact criteria:

City of Carson Traffic Impact Criteria, Signalized Intersections		
LOS	Final V/C Ratio	Project-Related Increase in V/C
E or F	> 0.900	equal to or greater than 0.020

##### **City of Compton and Los Angeles County**

Both the City of Compton and the County of Los Angeles utilize the criteria defined in the County's *Traffic Impact Analysis Report Guidelines* to assess project impacts:

Los Angeles County Traffic Impact Criteria, Signalized Intersections		
LOS	Pre-Project V/C Ratio	Project-Related Increase in V/C
C	> 0.700 - 0.800	equal to or greater than 0.040
D	> 0.800 - 0.900	equal to or greater than 0.020
E or F	> 0.900	equal to or greater than 0.010

## EXISTING PLUS PROJECT IMPACT ANALYSIS

### EXISTING PLUS PROJECT TRAFFIC LEVEL OF SERVICE

The Existing plus Project traffic volumes presented in Appendix A were analyzed to determine the projected V/C ratios and LOS for each of the analyzed signalized intersections under this scenario, using the ICU methodology utilized by Carson, Compton, and Los Angeles County. Table 5 summarizes the Existing plus Project LOS. Analysis sheets are provided in Appendix C. As indicated in Table 5, three of the six analyzed intersections are projected to operate at LOS A or B during both morning and evening peak hours with the Project. The intersection of Central Avenue & Victoria Street, in the City of Carson, is expected to operate at LOS B in the AM peak hour and LOS C in the PM peak hour. The intersections of Central Avenue & Artesia Boulevard and Central Avenue & Albertoni Street, both in the City of Compton, are expected to operate at LOS C during both peak hours. Detailed LOS analysis sheets for the Project are provided in Appendix C.

### EXISTING PLUS PROJECT INTERSECTION IMPACTS

Table 5 shows that the proposed Project would not result in significant traffic impacts at any of the six study intersections.

## FUTURE PLUS PROJECT IMPACT ANALYSIS

### FUTURE BASE TRAFFIC LEVEL OF SERVICE

The year 2021 Future Base peak hour traffic volumes were analyzed to determine the projected V/C ratio and LOS for each of the analyzed intersections using the ICU methodology. Table 6 summarizes the future LOS. Three of the six intersections analyzed for impacts are projected to operate at LOS A or B during the morning and afternoon peak hours under Future Base conditions. The intersection of Central Avenue & Victoria Street, in the City of Carson, is projected to operate at LOS B during the AM peak hour and LOS D during the PM peak hour. The intersection of Central Avenue & Artesia Boulevard, in the City of Compton, is projected to operate at LOS D during both the AM and PM peak hours. The intersection of Central Avenue & Albertoni Street/SR 91eastbound ramps, also in the City of Carson, is projected to operate at LOS E during the AM peak hour and LOS D during the PM peak hour. Detailed LOS analysis sheets are provided in Appendix C.

### FUTURE PLUS PROJECT TRAFFIC LEVEL OF SERVICE

The Future (year 2021) plus Project peak hour traffic volumes, provided in Appendix A, were analyzed using the ICU methodology to determine the projected future operating conditions with the addition of the proposed Project traffic. The results of the Future (year 2021) plus Project analysis are also presented in Table 6, with analysis sheets provided in Appendix C. Three of the six intersections analyzed are projected to operate at LOS A or B during the morning and afternoon peak hours under Future (year 2021) plus Project conditions. The intersection of Central Avenue & Victoria Street, in the City of Carson, is projected to operate at LOS B during the AM peak hour and LOS D during the PM peak hour. The intersection of Central Avenue & Artesia Boulevard, in the City of Compton, is projected to operate at LOS D during both the AM and PM

peak hours. The intersection of Central Avenue & Albertoni Street/SR 91 eastbound ramps, also in the City of Carson, is projected to operate at LOS E during both the AM and PM peak hours. Detailed LOS analysis sheets for the Project are provided in Appendix C.

### FUTURE (YEAR 2021) PLUS PROJECT INTERSECTION IMPACTS

As shown in Table 6, using the criteria for determination of significant impacts, it is determined that the proposed Project would not result in significant impacts at any of the six intersections under Future (year 2021) plus Project conditions.

## UNSIGNALED INTERSECTION SIGNAL WARRANT ANALYSIS

The proposed Project driveway is currently planned as the fourth leg to the existing three-legged uncontrolled intersection of Central Avenue and Aspen Hill Road. Central Avenue at this location provides two through lanes in each direction, as well as left-turn pockets for both northbound and southbound turns. Aspen Hill Road provides gate-controlled access into Dominguez Hills Village. The outbound driveway provides one shared right-left lane onto Central Avenue. In order to assess whether the addition of the Project driveway to the existing three-legged, side-street stop-controlled intersection will warrant signalization, a traffic signal warrant analysis was prepared utilizing the California Manual on Uniform Traffic Control Devices peak hour warrant. Traffic volumes utilized in the warrant analysis were collected on February 20, 2018.

A 24-hour traffic count on Central Avenue confirmed the AM peak hour as the peak hour with the highest volumes through the intersection. The count sheet for this 24-hour count is included as Appendix D. Morning peak hour volumes at the unsignalized intersection were therefore analyzed under Existing, Existing plus Project, Future Base, and Future plus Project conditions. As shown in Appendix E, the volumes at the Central Avenue & Aspen Hill Road/Project Driveway intersection did not meet the signal warrant thresholds during the AM peak hour under any of the analysis scenarios.

## FREEWAY RAMP INTERSECTION ANALYSIS

Per Caltrans' *Guide for the Preparation of Traffic Impact Studies* (Guide), it is recommended that traffic impact analysis evaluate the potential effects of a development project on intersections along nearby State highway facilities, including ramp terminal intersections. The analyzed study intersections include two freeway ramp terminal intersections.

4. South Central Avenue & East Artesia Boulevard/SR 91 westbound ramps
5. South Central Avenue & East Albertoni Street/SR 91 eastbound ramps

## FREEWAY RAMP INTERSECTION LEVEL OF SERVICE ANALYSIS

LOS calculations were conducted using the Synchro 10.0 traffic analysis software and are reported using the *Highway Capacity Manual* (HCM) methodology. The analysis was conducted in accordance with methodologies outlined in the Caltrans Guide. Each intersection was configured according to its existing configuration, including signal timing and physical geometry. Four scenarios were tested for the AM and PM weekday peak hours:

- Existing Year (2018)
- Existing plus Project
- Future Year (2021)
- Future Year plus Project

The traffic volumes for each of these scenarios are consistent with those described in Chapter 3. Signal timing plans were obtained from the City of Compton and are shown in Appendix F.

## FREEWAY RAMP LEVEL OF SERVICE CRITERIA

Under the HCM methodology, LOS is measured in seconds of delay and assigned a letter grade A through F, where LOS A through D is considered acceptable and operations are considered unacceptable at LOS E or F. Signalized intersection LOS is reported as a weighted average delay for all movements. Table 7 shows the HCM definitions for LOS at signalized intersections.

**TABLE 7 – LEVEL OF SERVICE DEFINITIONS FOR SIGNALIZED INTERSECTIONS, 6<sup>TH</sup> EDITION HCM  
OPERATIONAL METHODOLOGY**

Level of Service	Average Total Delay (seconds/vehicle)	Definition
A	$\leq 10.0$	EXCELLENT. No vehicle waits longer than one red light and no approach phase is fully used.
B	$> 10.0$ and $\leq 20.0$	VERY GOOD. An occasional approach phase is fully utilized; many drivers begin to feel somewhat restricted within groups of vehicles.
C	$> 20.0$ and $\leq 35.0$	GOOD. Occasionally drivers may have to wait through more than one red light; backups may develop behind turning vehicles.
D	$> 35.0$ and $\leq 55.0$	FAIR. Delays may be substantial during portions of the rush hours, but enough lower volume periods occur to permit clearing of developing lines, preventing excessive backups.
E	$> 55.0$ and $\leq 80.0$	POOR. Represents the most vehicles the intersection can accommodate; may be long lines of waiting vehicles through several signal cycles.
F	$> 80.0$	FAILURE. Backups from nearby locations or on cross streets may restrict or prevent movement of vehicles out of the intersection approaches. Tremendous delays with continuously increasing queue lengths

Source: *Highway Capacity Manual, Special Report 209*,  
Transportation Research Board, 2010.

## FREEWAY RAMP LEVEL OF SERVICE RESULTS

Table 8 and 9 present a summary of ramp intersection LOS analysis using the HCM methodology for Existing and Existing plus Project conditions and Future and Future plus Project conditions, respectively. The Existing and Existing plus Project traffic volumes presented in Appendix C were analyzed to determine the projected delay and LOS for each of the analyzed ramp intersections. Analysis reports are provided in Appendix H, along with the signal timing reports, and 95%ile ramp queue reports. As indicated in Tables 8 and 9, all analyzed intersections are projected to operate at LOS C or better during both peak hours in the Existing condition, and at LOS D or better in the Future condition.

## FREEWAY RAMP ANALYSIS SUMMARY

Per the Guide, Caltrans endeavors to maintain a target LOS at the transition between LOS "C" and LOS "D" on state highway facilities, however, Caltrans acknowledges that this may not always be feasible. If an existing State highway facility is operating above the appropriate target LOS, the existing measure of effectiveness (MOE) should be maintained.

Based on these guidelines, a project-related impact is considered significant when the baseline LOS is C and becomes D with the addition of the Project, the baseline LOS is D and becomes E with addition of the Project, or the baseline LOS is E and becomes F with addition of the Project.

Since the addition of Project traffic is not projected to degrade the LOS from C to D, from D to E, or from E to F at any of the study ramp terminal intersections, the Project impacts on the intersections would be less than significant.

## 5. REGIONAL TRANSPORTATION SYSTEM ANALYSIS

This section presents an analysis of potential impacts on the regional transportation system. Analysis at CMP monitoring stations was conducted in accordance with the procedures outlined in *Congestion Management Program*. The CMP requires that, when an environmental impact report is prepared for a project, traffic and transit impact analyses be conducted for select regional facilities based on the quantity of project traffic expected to use those facilities.

### CMP REGIONAL TRAFFIC IMPACT ANALYSIS

The CMP guidelines require that the first issue to be addressed is the determination of the geographic scope of the study area. The criteria for determining the study area for CMP arterial monitoring intersections and for freeway monitoring locations are:

- All CMP arterial monitoring intersections where the proposed project will add 50 or more trips during either the AM or PM peak hours of adjacent street traffic.
- All CMP mainline freeway monitoring locations where the proposed project will add 150 or more trips, in either direction, during either the AM or PM peak hours.

### SIGNIFICANT CMP TRAFFIC IMPACT CRITERIA

The CMP traffic impact analysis guidelines establish that a significant project impact occurs when the following threshold is exceeded:

- The proposed project increases traffic demand on a CMP facility by 2% of capacity (V/C 0.02), causing LOS F ( $V/C > 1.00$ )
- If the facility is already at LOS F, a significant impact occurs when the proposed project increases traffic demand on a CMP facility by 2% of capacity (V/C 0.02)

### ARTERIAL CMP MONITORING STATION ANALYSIS

None of the study area intersections are CMP arterial monitoring locations. The CMP arterial monitoring stations nearest to the Project study area are:

- Alameda Street & SR-91 eastbound Ramps (City of Compton)
- Alameda Street & Del Amo Boulevard (City of Carson)
- Vermont Avenue & Artesia Boulevard (City of Gardena)

The CMP arterial monitoring station closest to the proposed Project site is at Alameda Street & SR-91 eastbound ramps, located 2.2 miles east of the proposed Project site. Vermont Avenue & Artesia Boulevard is located approximately 2.7 miles west of the proposed Project site, and Alameda Street & Del Amo Boulevard is located 3.1 miles southeast of the proposed Project site. Based on the Project trip distribution

and trip generation, the Project is not expected to add 50 peak hour vehicle trips through the closest CMP arterial monitoring station. The majority of Project trips are anticipated to disperse among the transportation network within close proximity to the study area and less than 5% of total Project trips (or fewer than a maximum of 5 trips during the highest peak hour) are expected at any of the CMP monitoring stations.

## FREEWAY CMP IMPACT ANALYSIS

The *2010 Congestion Management Program* (CMP) (Metro, 2010) for Los Angeles County requires that all CMP mainline freeway monitoring locations where a proposed Project will add 150 or more trips, in either direction, during either the AM or PM peak hours be analyzed. The closest CMP freeway monitoring station to the Project are located on the Gardena Freeway west of the interchange with the Long Beach Freeway (I-710) and on the San Diego Freeway (I-405) south of the interchange with the Harbor Freeway (I-110). The proposed Project is expected to generate just 81 total trips in the AM peak hour and 98 total trips in the PM peak hour, therefore fewer than 150 trips will be added to the closest CMP monitoring sites during the AM and PM peak hours. CMP analysis is not required and was not conducted.

## REGIONAL TRANSIT IMPACT ANALYSIS

Potential transit related person-trips generated by the proposed Project were estimated. Appendix D.8.4 of the 2010 CMP provides a methodology for estimating the number of transit trips expected to result from a proposed Project based on the projected number of vehicle trips. This methodology assumes an average vehicle ridership (AVR) factor of 1.4 in order to estimate the number of person trips to and from the Project and then provides guidance regarding the percentage of person trips assigned to public transit depending on the type of use (commercial/other versus residential) and the proximity to transit services. Appendix D.8.4 of the 2010 CMP recommends summarizing the fixed-route local bus services within ¼ mile of the Project site and express bus routes and rail service within two miles of the Project site.

The Project is located within ¼ mile of bus stops serving Metro Local Routes 53 and 130 and Torrance Transit Route 6, and within 2 miles of the Metro Silver Line Victoria Street station, and the Blue Line Artesia station. However, the Project is not located within ¼ mile of a designated CMP transit center, multi-modal transportation center, or transit corridor. Therefore, the CMP guidelines provide that approximately 3.5% of total person trips generated are assumed to use transit to travel to and from the site. The proposed Project would have an estimated increase in vehicle trip generation of approximately 81 vehicle trips during the AM peak hour and 98 during the PM peak hour. Applying the AVR factor of 1.4 to the estimated vehicle trips would result in an estimated increase of approximately 113 and 137 person-trips during the AM and PM peak hours, respectively. Applying the 3.5% transit use would result in approximately 4 new transit person-trips during the weekday AM peak hour and 5 new transit person-trips during the weekday PM peak hour.

Within the two miles of the Project site, Metro operates the Blue Line (801) with 12-minute headways during peak hours and the Silver Line (950) with 5-minute headways during peak hours. Within a ¼ mile of the Project site, Metro also operates Local Routes 53 (approximately 25-minute headways during the peak hours) and 130 (approximately 40-minute headways during the peak hours), and Torrance Transit operates Route 6 with approximately 40-minute headways during the peak hours. The total of these services has an

estimated seating capacity of 2,496 persons per hour during the peak periods based on a seating capacity of 40 persons for a local bus, 65 persons for a Rapid articulated bus, and 300 persons for a light rail vehicle. The proposed Project would utilize up to 0.2% of available transit capacity during the peak hours using the CMP assumption of transit trips equating to 3.5% of person trips. At this level of transit capacity utilization, the Project is not anticipated to result in a significant CMP transit impact.

## 6. PARKING AND SITE CIRCULATION ANALYSIS

This chapter presents an analysis of the parking supply and access system proposed by the project. Based on the applicable code requirements as specified by the City of Carson, the required parking supply was estimated. Issues relating to the project's proposed site access and internal circulation design were also evaluated using standard guides for the types of vehicles expected to use these facilities.

### CITY OF CARSON PARKING REQUIREMENTS

The parking analysis for the proposed project compared the proposed parking supply to the requirements of the Dominguez Hills Village Specific Plan (Plan), in which area the Project is located. According to the Plan, a proposed development project is required to provide an adequate supply of parking spaces based on the proposed land uses on the site. The proposed project is considered to have a significant parking impact if the proposed parking supply is below that specified by the Plan. The Plan is currently in the process of being amended; draft Plan parking requirements have been provided verbally by the Project applicant and will be verified by City staff.

The project involves development of 175 two- and three-bedroom multifamily dwelling units in a garden-style low-rise complex. Per the draft amended Plan, 2.35 dedicated parking spaces per dwelling unit are required, including guest spaces, yielding a total requirement of 411 parking spaces. The project would provide a total of 419 parking spaces, including 350 dedicated residential garage spaces, and 69 guest surface spaces, equal to 2.39 parking spaces per dwelling unit. Table 10 provides a summary of parking requirements and proposed supply.

**TABLE 10 – PARKING REQUIREMENT ESTIMATES**

Parking Ratio		
Land Use	Ratio	
Dwelling units	2.00	per DU
Guest spaces	0.35	per DU
Parking Requirements per City of Carson Code		
Land Use	Size	Required Spaces
2-bedroom dwelling units	175 DU	
<i>Primary spaces</i>		350
<i>Guest spaces</i>		61
<b>TOTAL REQUIRED</b>		<b>411</b>
<b>SPACES PROVIDED</b>		<b>419</b>
<b>TOTAL NEEDED</b>		<b>-8</b>

## SITE ACCESS AND CIRCULATION

As shown in Figure 2, the proposed project would provide two driveways, one on Central Avenue and one on Victoria Street. The driveway on Central Avenue will serve as the primary project driveway. It will provide full-access ingress and right-turn only egress. Left turns out of the project driveway will be discouraged by signage and a physical barrier located at the project driveway. The driveway on Victoria Street will provide left- and right-turn egress only. The residential driveway on Central Avenue will provide the eastern leg of Central Avenue & Aspen Hill Road, while the driveway on Victoria Street will form a T-intersection.

## SITE CIRCULATION

### DRIVE AISLES

Inside the Project site, the drive aisle widths vary from 20 feet (in alleys) to 26 feet (along primary internal circulation routes and the fire lane), with two-way operation. The drive aisle widths meet the minimum recommended width for two-way operation.

Most of the proposed parking is located in garage spaces on the ground floor level of individual units. Guest parking spaces are provided in surface parking, located on the eastern edge of the property and near the southwestern edge. Guest spaces measure 9 feet by 16 feet, which is shorter than the 20 feet in length required by Carson Municipal Code (CMC) 9162.41. Seven surface parking spaces are identified as compact spaces; these spaces measure 8 feet by 15 feet, in compliance with CMC 9162.41.

### EMERGENCY VEHICLE AND WASTE DISPOSAL VEHICLE ACCESS

A test was performed that determined a 44-foot pumper fire truck and a 38-foot rear-load garbage truck found in *A Policy on Geometric Design of Highways and Streets 2004* was able to enter and exit the primary driveway turning radii without any conflicts; however, firetrucks inbound and outbound to the residential alleys do need to make wide turns that require partially crossing over onto landscaping for some portion of their turn in and out of the alleys. Truck turning movements are presented in Appendix G.

## 7. SUMMARY AND CONCLUSIONS

### PROJECT SUMMARY

The following summarizes the results of the Project transportation impact analysis for the proposed Victoria Greens Project in the City of Carson:

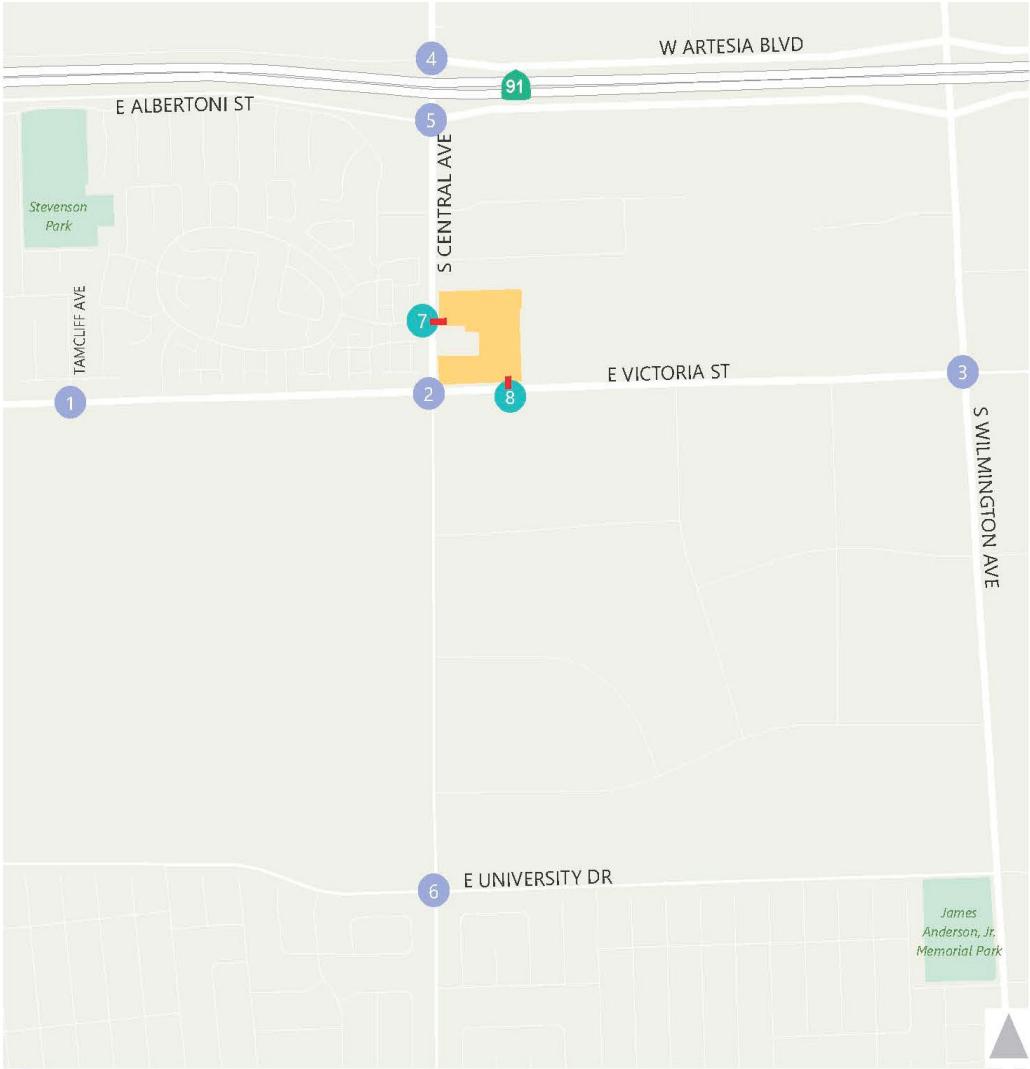

- The Project consists of the construction of 175 residential units.
- The Project will provide access via a driveway on Central Avenue located opposite Aspen Hill Road. Egress from the Project via Central Avenue driveway will be limited to right-turns only at all times. The project will provide an additional egress-only driveway on Victoria Street. That driveway will also serve as a secondary access point for emergency vehicles if ever necessary.
- The Project is projected to generate approximately 1,281 daily trips, including 81 trips during the AM peak hour, and 98 trips during the PM peak hour.
- The LOS analysis for the Existing plus Project scenario determined that the Project would not result in significant impacts at any of the six study intersections.
- The LOS analysis for the Future plus Project scenario determined that the Project would not result in significant impacts at any of the six study intersections.
- A signal warrant analysis concluded that the addition of the primary project driveway to the existing three-legged intersection of Central Avenue and Aspen Hill Road would not warrant installation of a traffic signal.
- Following Caltrans guidelines, HCM delay-based LOS analysis determined that the Project would not result in significant impacts at the two freeway ramp intersections within the study area.
- The project would not result in a significant impact to any CMP arterial or freeway monitoring stations. The projected level of additional transit riders generated by the proposed Project would not result in a significant impact on public transit services in the vicinity of the Project.

## **DETECTOR ASSIGNMENT WORK SHEET**

## DETECTOR ASSIGNMENT DEFINITIONS

CONTROLLER		CONNECTOR'S A, B, C								CONNECTOR D								CONNECTOR TELEMETRY								CONNECTOR TYPE 1							
ASC-2	DETECTOR								DETECTOR								DETECTOR								INPUT TYPE 1 ONLY								
	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20	21	22	23	24	25	26	27	28	29	30	31	32	

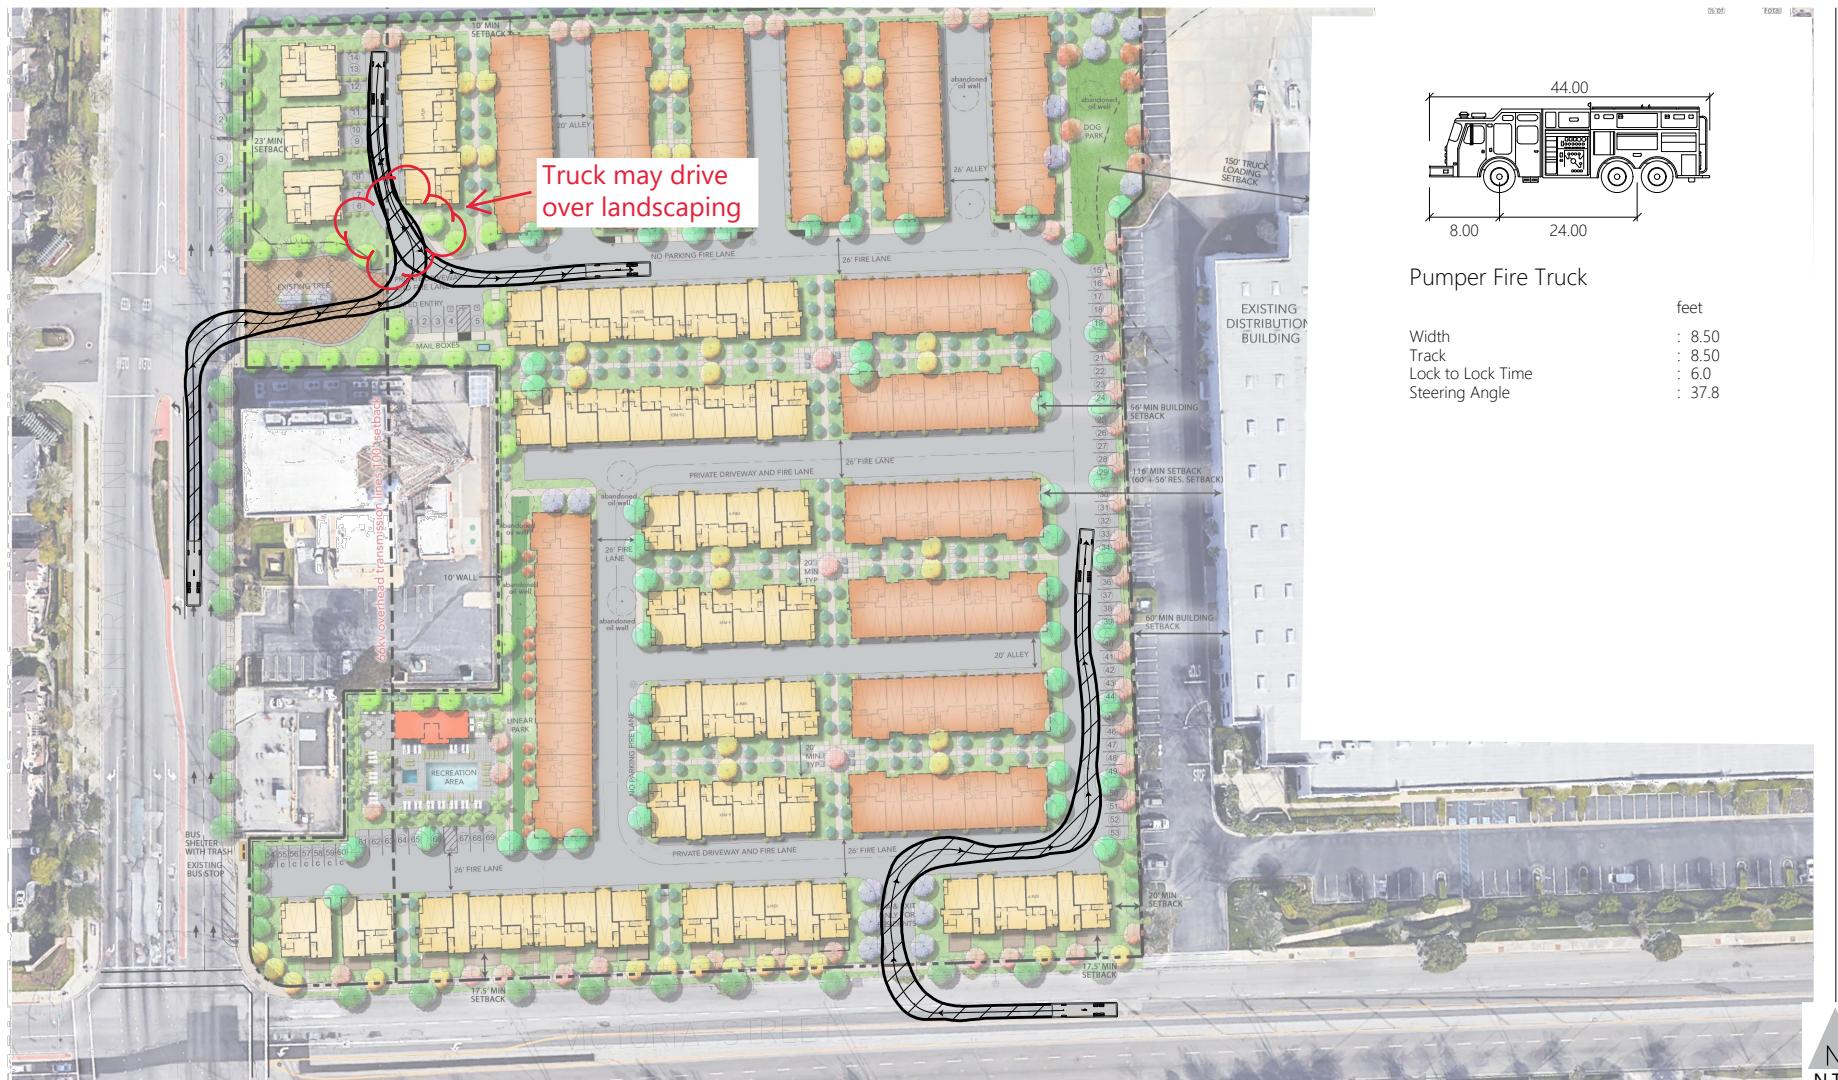

\* = DELAY Time or EXTEND Time set on External Sensor

**\*\*** = When the Detector Input is set to be a TYPE 4 Detector, the EXTEND value set in the Controller becomes the QUEUE MAX value and any Extension Time needed must be set externally on the Sensor. If the Detector Input is set to be a TYPE 5, the EXTEND value becomes a Reset (Gap) Timer value and the Extension Time is set Externally on the Sensor Unit.

**Q = QUEUE CLEARING LOOP      E = FIRST VEHICLE LOOP**

H = HOLDING LOOP                            A = ADVANCE LOOP

## Intersection Summary

- ~ Volume exceeds capacity, queue is theoretically infinite.
- Queue shown is maximum after two cycles.
- # 95th percentile volume exceeds capacity, queue may be longer.
- Queue shown is maximum after two cycles.
- m Volume for 95th percentile queue is metered by upstream signal.

## Intersection Summary

Area Type: Other

Cycle Length: 90

Actuated Cycle Length: 90

Offset: 27 (30%), Referenced to phase 2:SBT and 6:NBT, Start of Green

Natural Cycle: 90

Control Type: Actuated-Coordinated

Maximum v/c Ratio: 1.07

Intersection Signal Delay: 49.5 Intersection LOS: D

Intersection Capacity Utilization 82.7% ICU Level of Service E

Analysis Period (min) 15

Splits and Phases: 4: Central Avenue &amp; Artesia Boulevard

## Lanes, Volumes, Timings

## 5: Central Avenue &amp; Albertoni Street
